3A9 Group Project [10 credits]

Co-ordinator:  Prof. Margaret O’Mahony
Lecturer(s):  Assoc. Prof. Roger West, Assoc. Prof. Sara Pavia, Assoc. Prof. Sarah McCormack

Four hours per week made up of 2 No. 1 hour lectures and 1 No. 2 hour Project Session are given over two semesters between October and April.

Module description, aims and contribution to programme
The group design project replicates all the key stages in a real civil engineering project. The groups are given a series of design briefs and are required to develop solutions, critiquing and refining them as the project develops. At the end of each of the three design phases each group produces a written report. During the project, speakers are invited to speak to the students on aspects of design relevant to the particular project.

The project comprises three stages: preliminary planning, structural design and construction planning. The project involves the planning of a construction project.

Learning outcomes
On completion of this module:

1. The student will be able to function as a member of a design team. Specifically, students will be able to:
   a. Allocate work between members of a group
   b. Plan as a member of a group
   c. Prepare oral and written presentations as member of a group
2. The student will be able to applying engineering knowledge gained in other modules to formulate solutions to multidisciplinary design problems
3. The student will be able to communicate the details of their design solutions effectively, both verbally and in writing
4. The students will be able to interpret the requirements from a design brief and formulate and appraise potential solutions. In the case of a construction project, this involves the ability to:
   a. Identify functional and operational requirements
   b. Identify the transport and other infrastructural requirements
   c. Appraise the environmental and social impact of the development
   d. Identify and appraise potential sites before making a selection
   e. Develop general arrangement drawings, ensuring that the functional requirements are satisfied
   f. Refine and develop plans to produce detailed structural plans and a viable construction sequence, usually presented in the form of a Gantt Chart
   g. Write a technical specification
   h. Produce a bill of quantities and calculate approximate construction costs
   i. Question the wider responsibilities of the engineering profession

Module content
Lectures on the module are directly related to, and are sequenced with, the required outputs of the project phases. In this regard on completion of the module, the student will be able to:-

- Describe the roles and obligations of the various parties to a contract in civil engineering and building
- Take off quantities and prepare a Bill of Quantities in accordance with the Civil Engineering Standard Method of Measurement for a simple structural element.
- Write a specification for a concrete or steel structure and have an appreciation of some of the forthcoming changes arising from the introduction of Eurocodes.
- Prepare a reinforced concrete detail drawing and from this prepare a bar bending schedule in accordance with standard principles.
- Develop an understanding of the properties of the ingredients of a concrete mix and be capable of designing a concrete mix to meet certain requirements in terms of durability, strength and workability.
- Identify the various formwork materials and support systems and be able to design formwork to resist certain concrete pressures to produce a finished structure to meet the specified dimensional tolerances.
- Analyse and explain the principles of construction, particularly within the context of the current building regulations
- Identify and design the detailed techniques and/or materials commonly used in the construction of buildings in Ireland.
- Recognise the symptoms of common defects in buildings and specify available remedial measures which may be used.
- Evaluate the environmental principles and practices underlying the construction of buildings.
- Develop a specification for and design environmental services for domestic, commercial and industrial buildings.
• Develop a specification for and design renewable energy options for domestic, commercial and industrial buildings.
• Design timber flooring systems for domestic and industrial use.

In addition this module introduces some additional content related to project management, for example, the development of Gantt charts. However, the majority of the module is concerned with developing communication skills, problem solving skills and group working skills. The content summary that follows details the individual phases of the group project and describes the group debates.

**Assessment**
The assessment is based on: (i) the three written reports that each group produces (worth a total of 75%), (ii) on performance in 8 No tutorials (@1%/tutorial, total = 8%), (iii) on a test at the end of semester 1 (worth 8%) and (iv) on site visit reports (worth a total of 9%). Failure to pass any of components (i) – (iv) may result in the student receiving a non-satisfactory report for the module as a whole. Students must pass the 3A9 module to be in good standing at the end of the JS academic year. Students who fail 3A9 will be required to undertake an individual project during the summer in advance of the supplemental examinations.

**Site Visits**
Site visits are scheduled for 2-5pm, every Friday during the First Semester. There will be four site visits. At the end of First Semester 4 site visits’ reports and one safety lecture report are required to be submitted.

**Textbooks**
Resource material comprising architectural resource data, preliminary structural design information and the Engineers Ireland code of professional ethics is available to students on Blackboard.
In addition, students are introduced to range of texts during the project sessions, for example the following texts are frequently used:

- Philosophy of Structures, Eduardo Torroja, University of California Press, 1958
- Aesthetics and Technology in Building, P.L. Nervi, Harvard University Press, 1966
- Structures: from theory to practice, Alan Jennings, Spon Press
- Structures: of why things don’t fall down, J.E. Gordon, Penguin
- The new science of strong materials: or why you don’t fall through the floor, J.E. Gordon, Penguin
- DOE/BRE/TRRL. Design of Normal Concrete Mixes. HMSO
- Standard Method of detailing structural concrete. I Struct.E.
- *Civil Engineering Standard Method of Measurement*. CESMM3. ICE
- Building Standards/ Regulation:
- National Sustainable Development Policy:
- Building Conservation Guidelines:

Further information will be provided on Blackboard.
