**Module Learning Outcomes with reference to the Graduate Attributes and how they are developed in discipline**

On successful completion of this module, students should be able to:

LO1. Explain the significant aspects that must be considered when describing and classifying soils (BOK).

LO2. Analyse the compaction characteristics of a soil in order to assess its suitability as an engineering fill material (BOK).

LO3. Explain the methods of measurement of the permeability of soils (BOK).

LO4. Explain the concept of effective stress and its relationship with the shear strength of soils (BOK).

LO5. Develop a site investigation strategy pertinent to a range of ground engineering works (BOK).

LO6. Estimate the total head, porewater pressures and discharges expected in a variety of engineering design situations (DI).

LO7. Estimate the capacity of soil deposits to support shallow foundations (DI).

LO8. Estimate the stresses induced in the ground and resulting settlements based on elastic analysis (DI).

**Graduate Attributes: levels of attainment**

To act responsibly - Enhanced
To think independently - Enhanced
To develop continuously - Enhanced
To communicate effectively - Enhanced
Soil Mechanics provides students with a basic knowledge of the fundamental concepts of soil behaviour and gives an introduction into general geotechnical engineering. The module describes the relationship between soils and their geological origins and demonstrates the significance of the particles-size distribution and mineralogy of the soil on its engineering behaviour. Soil description and classification methods are covered. The effects of the compaction process on the engineering properties of soil are discussed and methods are developed to allow students to design fills. The module explains the principles involved in the flow of water through soils, including methods of analyses and measurement. The important concept of effective stress is described and examples of its significance in geotechnical engineering are developed. The module discusses the shear strength of soils, its measurement, and presents methods for applying this knowledge in the analysis of the short- and long-term bearing capacities for shallow foundations. The module presents elastic methods of analyses for predicting the in-situ stresses induced by surface loading and the resulting settlements. Methods for analysing the short-term stability of soil slopes are presented. Ground investigation and in-situ testing techniques are described for the development of ground model and the determination/interpretation of design parameter values.

Module content

- Description and classification of soils
- Seepage
- Compaction technology
- Effective stress concept and calculation
- Ground investigation and in-situ testing
- Shear strength
- Bearing capacity of shallow foundations
- Elastic settlements
- Slope stability (undrained condition)

Teaching and Learning Methods

Lectures, three number of laboratory practicals
### Assessment Details

Please include the following:

- **Assessment Component**
- **Assessment description**
- **Learning Outcome(s) addressed**
- **% of total**
- **Assessment due date**

### Reassessment Requirements

100% written examination

### Contact Hours and Indicative Student Workload

**Contact hours:**
33 scheduled lectures, 3 Laboratory Practical Sessions

**Independent Study (preparation for course and review of materials):**

**Independent Study (preparation for assessment, incl. completion of assessment):**

### Recommended Reading List

### Module Pre-requisite

Mechanics of Solids

### Module Website

No

### Module Approval Date

September 2020

### Academic Year of Date

2020-21

**COVID-19 contingency statement:**

______________________________
While the intention is to deliver some lectures, tutorials and labs face-to-face, there is uncertainty due to the Covid-19 situation and the entire module delivery may need to change to an online delivery if required by government restrictions. In the case of a possible new lockdown scenario during teaching term:

- All lectures, tutorials and labs will be delivered online using Blackboard, pre-recorded BOK, and pre-recorded/live DI. Your attendance at live sessions is required.
- Assignments and examinations will be conducted and submitted online.
