TR060: Biological and Biomedical Sciences introduction

Welcome to the second year of the Biological and Biomedical Sciences Stream at Trinity College Dublin.

This year you will consolidate your understanding of the biology learned in your Junior Freshman year. The material introduced in the Junior Freshman core modules From Molecules to Cells I and From Organisms to Ecosystems I will be developed further in the Senior Freshman modules From Molecules to Cells II and From Organisms to Ecosystems II. A third core module From Cells to Organisms will bring the student from the functioning of the cell to the integrated functioning of perceiving, thinking and acting in prokaryotic and eukaryotic organisms. Statistical and computational skills that are relevant for the analysis of biological systems and the history, philosophy and ethics of science comprises the remaining core modules.

Students will have the opportunity to expand their scientific knowledge and pursue their individual interests by choosing open modules from a cohort of topics such as geoscience, chemistry for biologists, sustainable production, infection and immunity, genomics, geometry and animal behaviour.

This year will see you deciding on which of the eleven possible exit routes you will choose which are called Moderatorships: Biochemistry; Botany; Environmental Science; Genetics; Human Genetics; Immunology; Microbiology; Molecular Medicine; Neuroscience; Physiology; Zoology.

Professor Andrew Jackson
Director, TR060 Biological and Biomedical Sciences Course

TR060 Biological and Biomedical Sciences overview and module selection

The Senior Freshman year will build on and expand on topics presented in the Junior Freshman year. The Senior Freshman year is divided into Semester 1 (Michaelmas term) and Semester 2 (Hilary term). Students must select modules to the value of 60 credits for the year with no more than 30 credits from Semester 1 and 30 credits from Semester 2.

MODULE SELECTION

In their SF year all students must take core modules for a total of 40 ECTS (20 ECTS per semester) as follows:

Code	Module Title	Semester	ECTS
BYU22201:	From Molecules to Cells II	Semester 1	10
BYU22202:	From Cells to Organisms	Semester 2	10
BYU22203:	From Organisms to Ecosystems II	Semester 2	10
BYU22S01:	Statistics and Computation	Semester 1	5
PIU22991:	History, Philosophy and Ethics of Science	Semester 1	5

Students will choose Open modules to the value of 20 credits (10 per semester) from the following:

BYU22204:	Sustainable Production: Food, Drink and Drugs	Semester 1	5
BYU22205:	Influences on Animal Behaviour	Semester 1	5
BYU22208:	Molecular Nutrition	Semester 1	5
BYU22206:	Microbes, Immune Systems, and their Interaction	Semester 2	5
BYU22207:	Genomes, Disease and Diversity	Semester 2	5
CHU22205:	Chemistry for Biologists	Semester 2	5
GSU22201:	From Atoms to Rocks: Introduction to Geochemistry	Semester 1	5
GSU22205:	Sedimentary Processes & Environments	Semester 1	5
GGU22006:	Physical Geography: Dynamic Earth	Semester 2	10
MAU23302:	Euclidian and Non Euclidian Geometry	Semester 2	5

TR060: BIOLOGICAL AND BIOMEDICAL SCIENCES

CORE MODULES (mandatory):

20 credits per semester

***Teaching term dates may be subject to change.**

SEMESTER 1 – Michaelmas Term 11 September 2023 – 01 December 2023	SEMESTER 2 – Hilary Term 22 January 2024 – 12 April 2024
BYU22201: From Molecules to Cells II (10 credits)	BYU22202: From Cells to Organisms (10 credits)
BYU22S01: Statistics and Computation (5 credits)	BYU22203: From Organisms to Ecosystems II (10 credits)
PIU22991: History, Philosophy and Ethics of Science (5 credits)	

OPEN MODULES (optional):

Students choose 10 credits from each semester

The module choice form is an online form and must be submitted by **4pm on Friday 21st April 2023**.

Forms are available online via the following link: [TR060 Senior Freshman Module Choice Form 2023-24](#)

BYU22204: Sustainable Production: Food, Drink and Drugs (5 Credits)	BYU22207: Genomes, Disease and Diversity (5 credits)
BYU22205: Influences on Animal Behaviour (5 Credits)	BYU22206: Microbes, Immune Systems and Their Interaction (5 credits) Prerequisite: BYU11101)
BYU22208: Molecular Nutrition (5 Credits) Prerequisites: BYU11101 & CHU11B01)	CHU22005: Chemistry for Biologists (5 Credits)
GSU22201: From Atoms to Rocks: Introduction to Geochemistry (5 credits Prerequisite: GSU11004)	GGU22006: Dynamic Earth (10 credits)
GSU22205: Sedimentary Processes & Environments (5 credits) (Prerequisite: GSU11005)	MAU23302: Euclidian and Non Euclidian Geometry (5 credits)

Moderatorships

In the Junior and Senior Freshman years TR060 students complete a course of study which will qualify them to compete for a place in one of the following Moderatorships after the Senior Freshman year:

- * Biochemistry
- Botany
- Environmental Sciences
- * Genetics
- * Human Genetics
- * Immunology
- * Microbiology
- * Molecular Medicine
- * Neuroscience
- * Physiology
- Zoology

* Students intending to apply for moderatorships marked with an asterisk are very strongly advised to take 'Chemistry for Biologists' as an open module in semester 2. This module is specifically designed and tailored to provide the foundational chemistry that supports these moderatorships in the molecular biological sciences.

Change of OPEN modules

If, after a couple of weeks, a student feels that they may have made the wrong choice of approved module combination, they should seek **advice immediately** from a Tutor, Course Director, or the Science Course Office. It may be possible to change from one module to another within your course, subject to permission from the Associate Dean of Undergraduate Science Education. Once a decision has been made to change modules, it should be done **quickly** - it can be difficult to try to catch up with work in a new module when more than two or three weeks of lectures have been missed.

Change of module forms are available online via the following link: [TR060 Senior Freshman Module Choice Form 2023-24](#)

All change of module requests must be submitted via the online module form [by Monday 2nd October 2023](#).

College registration

The Academic Registry issue an **'Invite to Register'** email to all continuing students eligible to register for the forthcoming academic year. This communication is issued via the my.tcd.ie portal and your institutional (TCD issued) email address.

On receipt of the emailed invitation, you should log in to the my.tcd.ie portal to complete the registration steps.

All information regarding College registration is available at the following links:

<https://www.tcd.ie/academicregistry/>

<https://www.tcd.ie/academicregistry/student-registration/>

The European Credit Transfer Accumulation System (ECTS)

The European Credit Transfer and Accumulation System (ECTS) is an academic credit system based on the estimated student workload required to achieve the objectives of a module or programme of study. It is designed to enable academic recognition for periods of study, to facilitate student mobility and credit accumulation and transfer. The ECTS is the recommended credit system for higher education in Ireland and across the European Higher Education Area.

The ECTS weighting for a module is a **measure of the student input or workload** required for that module, based on factors such as the number of contact hours, the number and length of written or verbally presented assessment exercises, class preparation and private study time, laboratory classes, examinations, clinical attendance, professional training placements, and so on as appropriate. There is no intrinsic relationship between the credit volume of a module and its level of difficulty.

The European **norm for full-time study over one academic year is 60 credits**. 1 credit represents 20-25 hours estimated student input, so a 10-credit module will be designed to require 200-250 hours of student input including class contact time, assessments, and examinations.

ECTS credits are awarded to a student only upon successful completion of the course year.

Progression from one year to the next is determined by the course regulations. Students who fail a year of their course will not obtain credit for that year even if they have passed certain component courses. Exceptions to this rule are one-year and part-year visiting students, who are awarded credit for individual modules successfully completed.

https://ec.europa.eu/education/resources-and-tools/european-credit-transfer-and-accumulation-system-ects_en

TR060 BIOLOGICAL AND BIOMEDICAL SCIENCES - CORE MODULES

BYU22201: From Molecules to Cells II

Semester 1, 10 credits

Prerequisite: BYU11101

Module coordinator: Prof Emma Creagh, ecreagh@tcd.ie Phone: 01 896 2539

Contact Hours: 35 hours lectures, 21 hours practicals

Module Personnel: E. Creagh, K. Mok, A Khan, J. Hayes, D. Nolan, R. Porter, M. Ramaswami, S. Martin, M. Campbell, U. Bond.

Learning Aims:

This module aims to give students a detailed understanding of cellular structure, composition and function. The molecular composition of organelles, the processes carried out in each organelle, and how these processes are integrated in cellular function are presented in detail. Students are also introduced to enzyme kinetics; cellular metabolism; DNA structure and replication, transcription, and translation; the regulation of gene expression; Mendelian inheritance and genetic disease. This module also introduces students to virology – how viruses replicate, mutate, enter cells and take over cellular processes during infection.

Module content:

Programme of lectures, practicals and essay writing practice: four lectures a week, Monday at 13:00, Wednesday at 17:00, Friday at 9:00 and 12:00, practicals Tuesday or Wednesday

Lecture Topic	Lecturer	Practical
Introduction to Module BYU22201 "From Molecules to Cells"	Prof Creagh	Practical 1 Solutions & Dilutions
Cell structure & intracellular transport	Prof Creagh	
Cell cytoskeleton I	Prof Creagh	
Cell cytoskeleton II	Prof Creagh	
Proteins & amino acids	Prof Mok	Practical 2. Spectrophotometry & Chromatography
Protein folding and purification	Prof Mok	
Oxygen binding proteins	Prof Mok	
Enzymes, catalysis and assays	Dr Khan	
Enzyme kinetics, inhibition & regulation	Dr Khan	
Enzymes – online Q&A session	Dr Khan	
Lipids - fatty acids & phospholipids	Prof Hayes	
Lipids – beta-oxidation & fatty acid synthesis	Prof Hayes	
Powering Life: energy transduction & life	Prof Nolan	

Bioenergetics 1: oxidative phosphorylation	Prof Nolan	Practical 3. Enzyme Kinetics
Bioenergetics 2: the universality of chemiosmosis	Prof Nolan	
Harvesting the light: photosynthesis	Prof Nolan	
Glycolysis	Prof Porter	
Gluconeogenesis	Prof Porter	
TCA cycle	Prof Porter	
Glycogen biosynthesis & degradation	Prof Porter	
Summary & integration of metabolism	Prof Nolan	
DNA – structure, replication, repair, recombination I	Prof Ramaswami	
DNA – structure, replication, repair, recombination II	Prof Ramaswami	
Reading Week -		
DNA – structure, replication, repair, recombination III	Prof Ramaswami	Practical 4. Differential Gene Expression I Essay Feedback
Transcription – RNA types, mRNA processing	Prof Ramaswami	
Transcription – RNA types, mRNA processing	Prof Ramaswami	
Regulation of gene expression: general principles	Prof Martin	Practical 5. Differential Gene Expression II
Gene expression in prokaryotes and eukaryotes	Prof Martin	
Chromatin and epigenetic effects on gene expression	Prof Martin	
Alternative splicing and protein translation	Prof Martin	
Mendelian inheritance	Prof Campbell	Practical 6. Assessment of Genetic Variation through Computational Analysis
Mapping Mendelian traits	Prof Campbell	
Quantitative traits and heritability	Prof Campbell	
Genetics of common diseases	Prof Campbell	
Virology: genetic diversity of viruses	Prof Roberts	
Virology: replication cycle 1- from entry to transcription	Prof Roberts	
Virology: replication cycle 2- from translation to virion formation & release	Prof Roberts	
Virology: emerging viruses – mutation, adaptation & transmission	Prof Roberts	
Revision Week		

There will be two in-course assessments of lecture material (multiple choice format). The first immediately after reading week, the second in the last week of semester.

Lecture Content:

- Introduction to the BYU22201 Module 'from Molecules to Cells'
- Revision of Cell structure (Podcast), Membrane structure & Intracellular protein transport mechanisms. (Elements Flipped classroom)
- Cellular cytoskeleton I (Actin filaments, myosin motor protein) (combination of flipped classroom & traditional lectures material) - Principles of cellular movement & the process of muscle contraction.
- Cellular cytoskeleton II – Importance of Microtubules & Intermediate filaments for cellular function (combination of flipped classroom & traditional lectures material). Specialised microtubules involved in the motility of cilia/flagella will be discussed.
- What are proteins? The 20 amino acids and their structures and properties, acid-base equilibria, the isoelectric point. (Combined flipped classroom and traditional lectures) The polypeptide chain and general properties of proteins. The hierarchy of protein structure (primary / secondary / tertiary / quaternary structures).
- Protein folding and protein misfolding diseases / neurodegenerative diseases. Protein purification and protein characterization techniques.
- Oxygen-binding proteins as an example of protein-ligand binding. Comparison of myoglobin and haemoglobin. Cooperativity. Bis-phosphoglycerate's role in oxygen affinity. Sick cell anaemia.
- Catalysis and the enzyme substrate relationship; Activation energy and the transition state. Michaelis-Menten kinetics; The active site- physicochemical properties; Enzyme assays.
- Principles of enzyme catalysis; Mechanisms of catalysis with examples; Reversible Inhibition; Allosteric regulation; Enzyme inhibitors as drugs Michaelis-Menten kinetics, limiting velocity, rate/enzyme correlation (in class activity supported by podcasts). Reversible inhibition and allosteric regulation.
- Lipids-Fatty Acids and phospholipids. What are lipids? Chemical and functional properties of diverse lipids such as steroid hormones, fat soluble vitamins and ketone bodies. Fatty acids, phospholipids and membranes.
- Lipids- β -oxidation and fatty acid synthesis. Energy production through the mobilisation of fatty acids from triacylglycerols and their oxidation in mitochondria. Energy storage through the synthesis of fatty acids and storage of triacylglycerols in adipocytes.
- Powering Life: Energy transduction & life. Introduction to basics: energy transduction in biological systems: concept of displacement from equilibrium, chemical potential, electrochemical potential and redox potentials. ATP and energy coupling: key concepts: Is ATP a high energy compound?
- Bioenergetics 1: Oxidative Phosphorylation. The machinery of oxidative phosphorylation: The electron transport chain and the universal turbine of life: the F_1F_0 -ATPase.
- Bioenergetics 2: The Chemiosmotic view of Life and the universality of the concept.
- Harvesting the light: Photosynthesis. The light reactions of photosynthesis: photophosphorylation, the Z scheme, PSI & II and C_1C_0 -ATPase. A comparison of oxidative and photo phosphorylation.
- Catabolism and anabolism. Sources of sugars in our diet. Glycolysis, its control and regulation. Catabolism of fructose and galactose. Fermentation.
- The necessity for gluconeogenesis. Its control and regulation. Substrate sources. Reciprocal control of gluconeogenesis and glycolysis in liver.
- Pyruvate dehydrogenase and control of regulation of oxidative catabolism of substrates via the tricarboxylic acid (TCA) cycle. The TCA cycle as a source of biogenic amines. The TCA cycle as a source of anabolic substrates. Anapleurotic reactions.
- What is glycogen? Breakdown of glycogen/glycogenolysis in liver and skeletal muscle. Its control and regulation. Flight or fight! The effect of starvation. Glycogen biosynthesis.
- Summary & Integration of Metabolism

- DNA – Structure, Replication, Repair, Recombination I. Discovery of DNA as the genetic material; structure, properties and conformation(s) of DNA; mechanism for DNA replication in prokaryotes and eukaryotes: DNA polymerases and the replisome.
- DNA - Structure, Replication, Repair, Recombination II. The role of telomeres in DNA replication in eukaryotes. Spontaneous and induced mutations; mutagens and the effects of mutations.
- DNA - Structure, Replication, Repair, Recombination III. DNA repair mechanisms; non-homologous end joining and homologous recombination.
- Transcription - RNA types and processing I. Discovery of RNA; properties and classes of RNAs; types of RNA polymerases; transcription in prokaryotes: initiation, elongation and termination.
- Transcription - RNA types and processing II. Types of RNA polymerases; transcription in eukaryotes: initiation, elongation and termination.
- Regulation of gene expression. The general principles of the regulation of gene expression in prokaryotes and eukaryotes.
- Gene expression in prokaryotes and eukaryotes. Mechanisms of the regulation of gene expression in prokaryotes and eukaryotes: promoters. Sigma factors, transcription factors, enhancers, silencers, insulators
- Chromatin and epigenetic effects on gene expression. Introduction to epigenetics; structure and composition of chromatin; histone and DNA modifications and their effects on chromatin and gene expression.
- Alternative splicing – protein translation. Mechanisms of alternative splicing. Initiation, elongation and termination of translation
- Mendelian Inheritance. Mendel's laws (revision of BYU11101) and molecular basis of inheritance patterns; pedigree analysis; gene interactions: dominance, co-dominance, incomplete dominance, recessivity, penetrance, expressivity, and epistasis.
- Mapping Mendelian traits: This lecture outlines the historical methods that were used to identify mutations in genes associated with Mendelian diseases. It highlights the methodology and underlying analysis with a focus on linkage and recombination.
- Quantitative traits and heritability: This lecture will focus on more complex traits, somatic mutations and heritability and how they pertain to human disease. The lecture uses examples of conditions such as breast cancer to describe the identification of genes that ascribe relative risk scores to disease.
- Genetics of common diseases: This lecture focuses on giving a wide range of examples of human disease that show Mendelian and non-mendelian modes of inheritance. It aims to give the student a broad understanding of the complexities of these diseases and the underlying genetic causes.
- Virology: genetic diversity of viruses. The diversity of viral genomes and particle structures will be explored in this lecture.
- Virology: Replication cycle 1 – from entry to transcription. In this lecture we will compare how different viruses enter cells and a range of viral strategies for producing mRNA.
- Virology: Replication cycle 2 – from translation to virion formation and release. In this lecture we will explore how the location within the cell of viral genome replication and assembly of new virions is dependent on the cellular processes a virus needs to utilise during replication.
- Virology: Emerging viruses – mutation, adaptation and transmission. In this lecture we will discuss a range of viruses causing emerging infections and explore how their replication cycles changed to adapt to new hosts or cell types.

Practical Content:

Practical 1 - Solutions & dilutions – This numerical skills activity will prepare students for numerical calculations relevant for lab work (eg. calculating molarities, how to make up buffers, dilution factors, etc.).

Practical 2 - Chromatography & spectrophotometry – During this laboratory session students will perform (1) **Ion Exchange Chromatography** and (2) **a spectrophotometric enzyme assay**: increasing

alcohol dehydrogenase (ADH) concentrations will be assayed - measuring the spectrophotometric production of NADH as the readout.

Practical 3 – Enzyme Kinetics - Students perform a stopped enzyme assay, using increasing substrate and inhibitor concentrations. They calculate the final concentrations in the assay, calculate K_m and V_{max} for uninhibited series, use Lineweaver-Burk plots to demonstrate competitive inhibition, and determine the K_i .

Practical's 4 and 5: Differential gene expression analysis

Practical 6: Assessment of Genetic Variation through Computational Analysis

Introduction to Bioinformatics; accessing and retrieving DNA sequence information from *Genbank*; comparison of homologous gene sequences using *BLAST*; identification of polymorphisms.

Essay Writing Exercise: the topic will be taken from the lecture course, given to students beginning of the semester. Students will prepare a 600-word essay on the given topic. The exercise is supported by advice on science essay writing and feedback will be provided to help students prepare for the end of module examination.

Learning Outcomes: On completion of this module students should be able to demonstrate an understanding of fundamental concepts in the following cellular structures and processes: the structure and function of cells and organelles; structures and functions of nucleic acids, proteins, carbohydrates and lipids; the fundamental concepts and regulation of metabolism; the composition, structure, synthesis and function of DNA and RNA; regulation of gene expression in prokaryotes and eukaryotes; chromatin structure and epigenetic regulation of gene expression; the principles of genetic inheritance; genetic diseases and fundamental concepts in virology.

Recommended Reading List: The topics and concepts presented in this module will be found in many general textbooks on cell biology, biochemistry, and genetics. The following are recommended for your guidance:

Essential Cell Biology. Alberts, Hopkin, Johnson, David Morgan, Raff, Roberts, Walter. (4th / 5th Editions). W. W. Norton & Company.

Biochemistry. Berg, Tymoczko, Gatto, Stryer (8th edition). Macmillan International.

Introduction to Genetic Analysis. Griffiths, Wessler, Carroll, Doebley (11th edition). W.H. Freeman and Co.

Assessment Details: The module has two components, course work (50% of module) and end-of module exam (50% of module). To pass the module students must achieve at least 40% in each component and achieve 40% overall. A failed component must be repeated in the supplemental period.

End of module examination structure: Exam is composed of:

- 10 short answer questions, testing understanding of concepts and deduction (25% of exam)
- 1 essay-type question from a choice of 3 questions on paper (25% of exam)

Course work structure

- Two in-course tests of knowledge of lecture content, 10% of module mark
- Essay writing exercise, 5% of module mark
- Practical write-ups/assessments (including practical exam), 35% of module mark

Contacts:

Module Coordinator: Emma Creagh, ecreagh@tcd.ie, Ph: 01 896 2539

Biology Course Coordinator: Glynis Robinson, robinsog@tcd.ie, Ph: 01 896 2895

Laboratory Managers: Audrey Carroll (Practicals 1 to 3) aucarrol@tcd.ie, Ph: 01 896 1620

Siobhan McBennett (Practicals 4 to 6) smcbrntt@tcd.ie, Ph: 01 896 1049

Executive Officer: btcadmin@tcd.ie, Ph: 01 896 1117

BYU22202: From Cells to Organisms

Semester 2, 10 credits

Prerequisite: BYU11101

Module coordinator: Prof Colm Cunningham, colm.cunningham@tcd.ie, Phone: 01 896 3964

Contact Hours: 37 hours lectures, 15 hours practicals

Module Personnel: C. Cunningham, S. O'Brien, D. Zisterer, P. Murphy, Á. Kelly, T. Ryan, A. Witney, A Ershova, C Kröger

Learning Aims:

This module aims to bring the student from the functioning of prokaryotic unicellular organisms right up to the integrated functioning of perceiving, thinking, and acting multicellular organisms. The module will give the students an appreciation of the highly specialised and dynamic communication between cells and tissues that brings about the functioning organism.

Module content:

Programme of lectures, laboratory practicals and writing skills exercise. four lectures a week, Monday at 9:00, Tuesday at 9:00 and 13:00, Wednesday at 17:00, practicals on alternate Wednesday

Lecture Topic	Lecturer	Practical
Introduction to BYU22202 "from Cells to Organisms"	Prof Cunningham	Practical 1. Adherence & the induction of bacterial gene expression Carsten Kröger
The bacterial world: diversity & unique extracellular structures	Dr O' Brien	
Energy, transport and scavenging in bacteria	Dr Anna Ershova	
Motility and chemotaxis in bacteria	Dr Anna Ershova	
Cell: Cell communication & bacterial development	Dr Anna Ershova	
Introduction to the bacterial cell envelope I	Dr O' Brien	
Introduction to the bacterial cell envelope II	Dr O' Brien	
Cell: Cell communication; autocrine, juxtacrine, paracrine & endocrine signalling	Prof Cunningham	
Cargo packaging for export	Prof Cunningham	
Calcium-dependent exocytosis for signal release (Neurotransmission I)	Prof Cunningham	Practical 2. Resting membrane and action potential Colm Cunningham
Signalling via ligand-gated ion channels (Neurotransmission II)	Prof Cunningham	
Intracellular signal-transduction: conserved mechanisms for responding to extracellular signals	Prof Zisterer	
Signalling through G-protein coupled receptors	Prof Zisterer	
Signalling through receptor tyrosine kinases and MAP kinases	Prof Zisterer	

Conservation of signalling pathways between organisms	Prof Zisterer	
Organising a body plan in multicellular organisms	Prof Murphy	
Cell signaling/cell communication in the context of development	Prof Murphy	Practical 3. Development Paula Murphy
Elaboration of positional information/progressive specification/cell lineage analysis	Prof Murphy	
How a cell responds to positional information	Prof Murphy	
Evolution/Development –body plan changes through evolution	Prof Murphy	Practical 4. Writing skills Colm Cunningham
Organogenesis	Prof Murphy	
Nervous control of physiological function	Prof Kelly	
Pharmacology of autonomic nervous system	Prof Kelly	
Reading Week		
Muscle physiology	Prof Kelly	Practical 5. Cardiovascular physiology Áine Kelly
Endocrine regulation of physiological function	Prof Kelly	
Fundamentals of cardiovascular & renal physiology I	Prof Kelly	
Fundamentals of cardiovascular & renal physiology II	Prof Kelly	
Pathophysiology and treatment of hypertension	Prof Kelly	
The immune system and its influence on homeostasis	Prof Cunningham	
Digestion & metabolism, metabolic syndrome, gut-brain axis	Prof Kelly	
Integration of nervous, endocrine and immune regulation of physiology; Importance in pathophysiology.	Prof Kelly	
Introduction to brain function, motor control	Prof Witney	
Sensation and perception	Prof Witney	
Pain, nociception and interoception	Prof Witney	
Learning and memory	Prof Ryan	
Emotion and motivation	Prof Ryan	
Understanding brain function through pathology/disease	Prof Ryan	
Summary - Revision/integration lecture	Prof Cunningham	

There will be two in-course assessments of Lecture material (multiple choice format).

The first will be immediately after reading week, the second in the last week of semester.

Lecture Content:

Unicellular to multicellular life

- Examples of signalling molecules released by bacteria and their effects on individual cells and populations
- Quorum sensing as a method of communication between bacteria within a population
- Regulatory and physiological adaptations to stress in bacteria
- ATP synthesis and the generation of proton motive force in bacteria
- Nutrient uptake mechanisms and transporters in bacteria
- Motility and chemotaxis in bacteria
- Extracellular structures such as fimbriae, capsules and S-layers and their role in adaptation to the environment
- Mechanisms employed by bacteria to attach to and interact with eukaryotic cells

Cell-cell communication & Signal Transduction

- The basic mechanisms of cell-cell communication including juxtacrine, autocrine, paracrine & endocrine signaling. From gap junctions and plasmodesmata (metabolic or electrical coupling), to contact-dependent signaling, neurotransmitter release at short range to hormone release at long range
- Packaging of cargo for export: protein synthesis and export via the trans-golgi network and the secretory pathway versus vesicular transporter-mediated packaging of synaptic vesicles (with provision of online resources)
- Neurotransmission as a specialized form of calcium-dependent exocytosis. Resting membrane potential and depolarization, the action potential, voltage-dependent calcium channels (with provision of online resources).
- Signalling via ligand-gated ion channels: neurotransmitter binding and gating of ion channels. Acetylcholine and end plate potentials at the neuromuscular junction. Glutamate and GABA receptors, excitation and inhibition.
- Highly conserved components of intracellular signal-transduction pathways-G proteins used as on/off molecular switches; protein kinases/phosphatases employed in virtually all signalling pathways; second messengers carry and amplify signals from many receptors. Concept of crosstalk between signalling pathways. Signal termination.
- General elements of G protein coupled receptor systems. GPCRs that activate or inhibit adenylyl cyclase. GPCRs that activate phospholipase C. Mechanisms that downregulate signalling from GPCRs. Integrating responses of cells to environmental influences.
- Receptor tyrosine kinases (e.g. EGF). Activation of ras and MAPK pathways. The role of protein binding domains in the specific interactions between signalling molecules. Pathways that involve signal-induced protein cleavage (e.g. Notch/Delta signalling).
- Signalling networks that respond to changes in nutrient and energy status of cell (e.g. SnRK1 and TOR kinases in plants). Signalling pathway conservation between organisms. Defects in signalling pathways leading to disease with emphasis on cancer.

Development

- **Organising a body plan in multicellular organisms:** The concepts of multicellular life and how an organized body plan, composed of different cell types and tissues, is established. Examples of relatively simple (hydra) organisms to the most complex (examples of drosophila, mouse, human and others) will be used. Fundamental similarities and differences in the organisation of animals and plants will be covered. Molecular and biophysical mechanisms governing cellular behaviour will be discussed.
- **Cell signalling/cell communication in the context of development.** Cell communication is fundamental to building an organized body plan. The main developmental signalling pathways

(Wnt, BMP, Hedgehog, FGF, YAP/hippo etc) will be introduced with examples of how they guide development. Pathway conservation and elaboration through evolution related to developmental complexity will be examined.

- **Elaboration of positional information over time.** Exploration of key concepts, moving from the “French flag model” to more sophisticated ways of thinking. The concept of gradients and graded influence across tissues. Progressive specification and how information builds over developmental time. Cell lineage analysis and tracing a cell through time. Stem cells and how stem cell niches are established during development
- **How a cell responds to positional information.** Transcriptional and post-transcriptional regulation leading to cellular differentiation. The integration of different types of information at the cellular level determining how a cell responds. The importance of the cellular context and epigenetics. Hox genes and how they relate to positional information – the concept of a positional code. Mutations that change the body plan.
- **Evolution & Development:** How body plans can change through evolution. The concept of “the Toolkit” for building an organism and “tinkering with the toolkit” – genetic changes that can lead to major body plan shifts such as loss of limbs or acquisition of specialised structures such as a turtle shell.
- **Organogenesis:** Development of organ and organ systems; e.g. heart, kidney, lung etc. building on the concepts and mechanisms involved in building complex structures, current knowledge on how specific organs are established will be presented and explained.

Human physiology

- Nervous control of physiological function: sensory and autonomic nerves. CVS as model system.
- Muscle function and its nervous control. Disorders of skeletal muscle, cardiac hypertrophy (physiological via exercise & pregnancy; pathophysiological via hypertension)
- Neuropharmacology, with specific emphasis on pharmacology of the autonomic nervous system; effect of toxins on neuromuscular junction
- Endocrine regulation of physiological function, highlighting endocrine disorders.
- Fundamentals of cardiovascular and respiratory physiology and their interaction (homeostatic responses to altitude, exercise)
- Fundamentals of cardiovascular and renal physiology and their interaction (regulation of blood pressure and volume, acid-base balance)
- Pathophysiology and treatment of hypertension (pharmacology of ANS, role of exercise in prevention and treatment)
- Digestion and metabolism, metabolic syndrome, the gut-brain axis.
- Immune regulation of physiological function (innate vs adaptive, role of inflammation in infection and cancer. Regulation of tissue homeostasis and role in obesity, diabetes and brain injury/neurodegenerative disease.
- Pathophysiology of diseases of the nervous system (MS, AD, PD, encompassing nervous, endocrine and immune regulation of physiology).

Neuroscience and Behaviour

- Sensation and perception. Students will gain an understanding of how the brain makes sense of sensory input. They will be aware of and able to explain fundamental discoveries (e.g. Hubel & Wiesel). They will be able to describe neuronal circuitry that enables us to distinguish between sensory input from the external world and that which is internally generated (sensory cancellation and efference copy mechanisms).
- Pain, nociception, and interoception. Students will attain and understanding of the internal awareness of the animal body to states such as pain.
- Motor coordination and control. Students will learn how the complexity of an animal’s movement is constrained by the underlying neural circuitry. Simple behaviours in simpler

animals and their underlying neural control (e.g. CPGs) through to complex voluntary action and manipulative tasks.

- Emotion and motivation. Students will develop an understanding of how we empirically study animal behaviours that can be attributed to motivational drives and emotional states and will attain knowledge of how environment experience and genetic background can alter these behaviours.
- Learning and memory. Students will be able to describe the basic learning theory models in the context of Pavlovian and operant conditioning, and basic invertebrate and vertebrate experimental models of learning-induced brain plasticity and memory storage.
- Understanding brain function through pathology/disease. Students will gain an understanding of how clinical studies of humans with brain damage and disease, when combined with careful behavioural and psychiatric analysis, and give us new insights into brain function at a systems level. An introduction to the use of animal disease models and a few highlights of how animal models have been used to develop an understanding of disease processes.

Practical Content:

Practical 1: Bacterial Adherence to Eukaryotic Cells & the Induction of Bacterial Gene Expression during Infection

Examination of buccal epithelial cells to observe adherence of resident microbial flora to cells. Determination of the induction speed of the acid-responsive *asr* gene of *Salmonella enterica* in the human stomach using Green Fluorescent Protein as a biosensor.

Practical 2: Simulation of resting membrane potential and action potential using Metaneuron.

Students will use a downloadable application to simulate neuronal behaviour. This will be used to examine the contribution of sodium and potassium ions to the resting membrane potential; contribution of sodium flux and alteration of membrane potential in induction of the action potential; relationship between stimulus intensity and stimulus delay in the refractory period

Practical 3: 3D Imaging and database research of embryonic development

Students will use online 3D databases of developing embryos, to investigate and describe changes in anatomical features during the formation of a 3D body plan and begin to explore the molecular changes that underpin morphological change.

Practical 4: Writing Skills Activity: A topic from the lecture series will be selected and students given approximately two weeks to prepare a first draft essay. Students will bring their drafts to a supervised session where they will peer review the drafts in small groups (under supervision) and attend a masterclass on writing skills. Final essays will be submitted a few days later.

Practical 5: Cardiovascular and respiratory physiology. In this class, fundamental cardiovascular and respiratory physiology parameters will be measured. Students will be trained in the use of standard physiological equipment and will explore regulation of heart rate, blood pressure and blood flow, along with respiratory volumes and control of breathing.

Learning Outcomes:

On successful completion of this module students will be able to:

- Describe the regulatory and physiological adaptations that bacteria undergo to acquire nutrients, respond to stress, and describe the structure, function and importance of bacterial extracellular structures and their roles in modulating cell-cell interactions. Utilise phenotypic tests and microscopy to characterise bacteria in the laboratory (Practical).
- Demonstrate an understanding of the role of signalling in bacterial communication in forming communities and the mechanisms used by bacteria to interact with eukaryotic cells
- Describe the multiple ways in which cells communicate with each other over short and long distances.

- Demonstrate an understanding of how biological signals are prepared for export, are temporally and spatially controlled, are sent, received, transduced and amplified in the cellular context (signal transduction), and provide examples as to how this is achieved in cells.
- Utilise online tools and databases to explore fundamental concepts relating to neurotransmission and to answer specific questions related to embryonic development including an appreciation of the power of using shared data in research (Practical's).
- Articulate the concepts of how biological complexity is established as the body plan of multicellular organisms emerge and integrate these concepts in the context of how body plans have evolved.
- Describe the contribution of the nervous, endocrine and immune systems to regulation of whole-body physiological homeostasis in humans and detail cell, tissue and organ integration in the cardiovascular, respiratory, immune, renal and digestive systems.
- Describe how alterations in physiological variables as a result of exercise, changes in barometric pressure or pathophysiological processes impact on homeostasis in different organ systems
- Measure and understand fundamental cardiovascular and respiratory variables in human subjects (Practical).
- Articulate how the brain achieves basic functions for the animal using examples from invertebrate & vertebrate neurobiology.
- Provide explanatory accounts of movement and motor control; sensation and interoception; emotion and memory, and how brain injury in human patients can inform us about brain function
- Describe, integratively, how the fundamental physiology of neural circuits can be used to explain behavioural function in both vertebrates and invertebrates.
- Demonstrate good practice in essay writing: including planning, drafting, responding to constructive review and timely submission of a final draft (Practical, graded for continuous assessment).

Recommended Reading List:

The topics and concepts presented in this module can be found in selected chapters of the following textbooks:

- Biology, A global Approach. Campbell *et al.* 12TH Edition. Pearson.
- Prescott's Microbiology 10th edition. McGraw Hill.
- Biochemistry. Berg, Tymoczko, Gatto, Stryer 8th edition. Macmillan International.
- Molecular Cell Biology. Lodish *et al.*, 8th edition. Macmillan International.
- Principles of Development. Wolpert, Tickle, Martinez-Arias. 5th Edition Oxford University Press.
- Developmental Biology. Gilbert, Barresi, 11th Edition. Sinauer, Oxford University Press
- Human Physiology from Cells to Systems. Sherwood. 9th Edition. Cengage Learning.
- Principles of Neurobiology. Liqun Luo. 1st edition. Garland Science.

Assessment Details:

Marks are allocated across two components, course work (50% of module mark) and end-of-module examination (50% of module mark). Students must pass both components. A student who fails the exam must repeat it, a student who fails the course work must submit supplemental course work as required.

BYU22203: From Organisms to Ecosystems II

Semester 2, 10 credits

Prerequisite: BYU11102

Module coordinator: Professor Nessa O'Connor, n.oconnor@tcd.ie Phone: 01 896 1640

Contact Hours: 38 hours lectures, 15 hours practical work

Module Personnel: N. O'Connor, F. Mitchell, N. Marples, L. Cassidy, D. Bradley, N. Payne, M. Williams, & P. Luijckx

Learning Aims:

This module builds on the key concepts introduced in BYU11102 including evolution, biodiversity, animal and plant physiology and ecosystem biology. While further introducing core principles that underpin the study of genetics, botany, zoology and global change biology.

Module content:

Programme of lectures and practicals, four lectures a week, Thursday at 12:00 and 15:00, Friday at 11:00 and 13:00, practicals on alternate Wednesdays.

Lecture Topic & Lecturer	Lecturer	Practical
Introduction to BYU22203 "Organisms to Ecosystems II	Prof O'Connor	
Diversity of life: Conquering the land	Prof Mitchell	
Diversity of life: fungi, lichens, algae, angiosperms	Prof Mitchell	
Diversity of life: animals, phylogeny and early evolution	Prof O'Connor	
Diversity of life: tetrapods and evolution of humans	Prof O'Connor	
Diversity of life: animal feeding strategies	Prof O'Connor	Molecular Genetics D. Bradley

Genes to ecosystems	Prof Luijckx	
Module Review	Prof O'Connor	

Lecture Content:

- **Module Introduction**

Learning outcomes, module aims, assessment details, recommended reading etc.

- **Diversity of life: Conquering the land**

This lecture explores the challenges that had to be overcome by organisms conquering the land in the geological past. The adaptations required will be addressed and how these adaptations are relevant to life on land today.

- **Diversity of life: fungi, lichens, algae, angiosperms**

This lecture will explore the evolution of diversity of plant life and how this diversity has facilitated the pivotal role that plants play in supporting all life on the planet.

- **Diversity of life: animals, phylogeny and early evolution**

This lecture introduces animal body plans, the early invertebrates and the significance of the Cambrian explosion. Students will learn to define an 'animal', radial symmetry, bilateral symmetry, ecdysis, lophotrochozoan and where these features fit on the phylogeny of animals. The lecture includes key characteristics of the major invertebrate phyla.

- **Diversity of life: tetrapods and evolution of humans**

This lecture describes the evolution of tetrapods from sea to land, including the major steps in the evolution of tetrapods, suggested reasons why tetrapods may have moved to land including when this may have occurred and how tetrapods are adapted to live on land. In addition, we explore how the many things that make humans "special" are not unique to humans. We will discuss how to tell if a fossil hominid was bipedal and how humans are still evolving with examples.

- **Diversity of life: animal feeding strategies**

The main feeding types of animals will be explored: suspension/filter feeders, substrate feeders, fluid feeders, bulk feeder's vs predators, herbivores, parasites, parasitoids. The great diversity of animals and how this relates to dietary adaptations will be discussed including examples of predators and their prey, herbivores and plants, and humans.

- **Diversity of life: animal reproductive behaviour**

Reproductive behaviour and evolution of mating systems, sexual selection *etc.*

- **Diversity of life: plant reproductive strategies**

This lecture will explore the diversity of reproduction strategies in plants, how they have evolved and how they can dictate the distribution of specific plant groups.

- **Darwin**

The main historical events leading to the evolutionary thinking under a Darwinian view will be discussed. This includes, but is not limited to, philosophy of organismal transformation, fixing forms, catastrophism and emergence of new life forms. This lecture also covers the stages by which Darwin came to his understanding of Natural Selection and ends with an overview of the natural selection process.

- **Natural selection**

The mechanism of natural selection as Darwin and Wallace conceived it, Mendel, the New Synthesis (NS), ways NS have been misunderstood, examples of NS in action, convergent and divergent processes with examples, directional, normalising and disruptive selection effects. Rates of change and fixation.

- **Species and speciation**

The species concept, and six approaches to defining what a species is will be explained and their various merits discussed. Examples from current work on speciation on islands in Indonesia being carried out by Prof Marples' group will be used to illustrate the use of genetic methods. The three mechanisms of speciation will be introduced including the concept of hybrid zones.

- **Coevolution**

We explore the concept of animals evolving in response to the evolution of other species using the case study of the warning coloration of insects co-evolving with their predators. This example is used to illustrate the complexity co-evolutionary processes including positive and negative frequency dependence, differing selection pressures and three types of mimicry.

- **The evolution of sex and sexual selection**

This lecture covers the problem of why evolving sexual reproduction is difficult, the reasons why it is costly and the possible individual and population level advantages which may lead to its evolution and maintenance. We then address Darwin's concerns about sexual selection and the evolution of maladaptive sexual characteristics and discuss the two main theories explaining extreme male ornaments.

- **Kin selection**

Five reasons for co-operative behaviour are introduced. The concept of group selection, and why it is flawed as an explanation for co-operation is explained, encountering the concept of evolutionary stable strategies in the process. Forced co-operation is discussed with examples, then kin selection is explored in detail, along with the concept of inclusive fitness, and calculating the coefficient of relatedness. Examples demonstrating kin selection are given and eusociality is discussed both in haplodiploid insects and in mole rats.

- **Evolution of reciprocity**

The lecture covers the remaining three reasons for co-operative behaviour, starting with examples of mutualisms, both with immediate and with delayed payoffs. The concept of reciprocal altruism is introduced, the evolution of tit-for-tat systems and the importance of policing both using theoretical animals and real-life examples. Finally, human altruism and experimental results that demonstrate a strong inclination towards policing being present in humans. The altruism practical, which students undertake in their own time, is introduced and the ethical considerations of working with the public are explained.

- **The molecular basis of Mendelian genetics.**

This lecture reintroduces Mendel's laws in the context of molecular genetics. Foundational/refresher content will be provided on heredity, the structure of DNA, genetic variation, the transmission/segregation of alleles, and the relationship between genotype and phenotype. Historical perspective is given on the characterisation of the molecular mechanisms of inheritance and their centrality to evolutionary theory. This serves to introduce a core paradigm: that all evolution ultimately occurs at the genetic level.

- **The principles of population genetics**

In this lecture, the mathematical consequences of Mendelian inheritance are expanded upon. We will learn how to describe the genetic variation that exists within and between biological populations in terms of allele and genotype frequencies. The concept of the "idealised" population in Hardy-Weinberg Equilibrium is introduced, where allele and genotype frequencies do not change through the generations. We then explore the deviations from this expectation. Specifically, we will look at the consequences of non-random mating on genotype frequencies, and the four main modes of allele frequency change (*i.e.* the four main forces of evolution): mutation, genetic drift, selection and gene flow.

- **Fitness and selection**

The concept of natural selection is revisited in this lecture, but this time from the perspective of allele frequency change over evolutionary time. We introduce the concept that genotypes can have different fitnesses in a given environment and explore how the relative quantification of these fitnesses allows us to predict allele frequency change. Students will learn how natural selection can be classified in different ways, including by its effect on phenotype distributions, genotype frequencies and new alleles. Real-world examples of natural selection acting upon a single locus will be provided, including data from the Irish population.

- **Genetic drift and neutral evolution**

In this lecture, we turn our attention to neutral genetic variation that has no overall effect on fitness. We will chart several major milestones in molecular biology, which allowed genetic variation in populations to be directly detected for the first time and led to the discovery that the vast majority of observed alleles are neutral. Students will learn how molecular sequencing techniques made cross-species comparisons possible and explore the consequences of genetic drift acting on neutral

allele frequencies over long evolutionary timescales. This provides the conceptual framework for the molecular clock hypothesis, which revolutionised the way in which we infer species relationships.

- **Molecular phylogenetics**

Building from the theory laid down in the previous lecture, we will learn how molecular sequence data can be used to reconstruct evolutionary history in the form of a phylogenetic tree. We establish the major aims of the field of phylogenetics and introduce the terminology required to read a phylogenetic tree. Methods for the construction of phylogenetic trees from multiple sequence alignments are explored.

- **Applied evolutionary genetics**

This lecture applies key concepts in population genetics, molecular evolution and phylogenetics to the study of a single species, *Homo sapiens*. We use molecular phylogenetics to uncover the origin of our species and characterise our relationship with archaic humans. Students will learn that each loci in the genome has an independent evolutionary history and whole genomes are required to understand the whole story of human evolution. We also untangle the interplay between selection and genetic drift to explain the persistence and distribution of inherited human diseases today.

- **Animal metabolism**

This lecture will explore the process of metabolism in animals, from perspectives of biochemistry, physiology, and ecology. Different metabolic pathways (e.g. aerobic and anaerobic) are introduced, and we will explore key factors that cause metabolic rates to vary: body size, temperature, and activity level. We then focus on the variety of adaptations (both physiological and behavioural) animals exhibit for regulating metabolic rates, and their ecological significance.

- **Thermoregulation and water stress in plants**

Extreme habitats, growth forms, thermoregulation through evapotranspiration and mitochondrial respiration, heat and water loss, structural and metabolic solutions to water loss.

- **Animal nutrition and digestion**

Having been introduced to the feeding strategies and energy requirements of animals, this lecture links those concepts by focussing on nutrition. The different types of essential nutrients will be introduced, as will be the various stages of food processing (from ingestion to elimination). We will examine the range of digestive systems seen across taxa, and look in a little more detail at characteristics of the mammalian digestive system. Focussing on vertebrates, examples of digestive system adaptations to deal with specific diets will also be presented.

- **Plant nutrition and digestion**

Nutrient deficiency in plants, serpentine soils and heavy metal accumulation, insectivorous plants.

- **Circulation and gas exchange in animals**

This lecture explores the immense variation in form and function of circulatory and gas-exchange systems seen in animals. By taking a largely comparative approach, we will examine the different types of respiratory systems (e.g. trachea, gills and lungs), modes of ventilation, and circulatory systems (open and closed) seen across invertebrates, fish, birds and mammals. We will also consider how physical attributes of water present challenges to gas exchange for aquatic animals, and how these can be overcome in groups such as 'water-breathing' sharks and deep-diving whales.

- **Circulation and Gas exchange in plants**

Plants are high pressure systems, the three transport pathways, biophysical 'pumps' in plants, water potential, gas exchange: CO₂ and O₂.

- **Life in extreme environments: evolutionary adaptations**

Polar, deep sea, high altitudes, deserts etc. Evolutionary adaptations for survival in plants and animals.

- **Interactions between organisms including mutualisms**

This lecture will explore the range of interactions between plants and animals. This will include both positive and negative interactions and how these interactions are a vital aspect of ecology.

- **Global climates and biomes**

How the global climate system operates. The relevance of the biome concept and overview of ecosystem function. How organisms respond and adapt to their environment.

- **Terrestrial ecosystems: forests and grassland**

Functioning and adaptations in forest and grassland ecosystems at individual, biome and global scales.

- **Ecological modelling**

The practicalities of ecosystem modelling. Demonstration and instruction relevant to the practical exercise and the role of fire in forest ecosystems.

- **Terrestrial ecosystems: desert, tundra and peatland**

Functioning and adaptations in desert, tundra and peatland ecosystems at individual, biome and global scales.

- **Freshwater ecosystems: rivers and lakes**

This lecture will provide a short broad introduction into these ecosystems followed by two in-depth examples of how climate change affects lake and river ecosystems thus providing both breadth and depth. Introduction to rivers and lakes. Formation, ecological importance. The water framework directive. Decrease in water quality in Irish rivers, multiple stressors and their interactions. Research example: Exstream system from Prof. Jay Piggott, climate, nutrients and sediment. Take home: Beware of ecological surprises, sediment not nutrients may be the most important stressor. Global warming and the spread of aquatic infectious diseases. Complexity of predicting the effect of global warming on disease. A few short contradictory examples of how climate change impacts disease in aquatic environments. Metabolic theory a potential solution Research example on climate and disease using the Daphnia system. Take home, complexity of temperature on species interactions.

- **Marine ecosystems: estuaries**

Classification, biological and environmental characteristics. Biological communities associated with estuaries. Estuarine ecosystem functioning and food webs, disturbance and biodiversity. Dublin Bay.

- **Marine ecosystems: coastal waters and open seas**

Characteristic features of shelf seas, habitat characteristics, associated biota and functional roles, food webs and human interactions. Characteristic features of the deep sea and associated fauna, with examples.

- **Impacts of global climate change**

Review of climate change predictions. Examination of how biomes have reacted to climate change in the past and the likely consequences of predicted climate change on global biomes.

- **Genes to ecosystems**

This lecture will demonstrate that the genetic make-up of a population can have large consequences for ecological and evolutionary processes. How genetic diversity can play a role in ecosystem functioning, biodiversity and resilience. Genetic diversity in keystone species can have a large effect on biodiversity. What does that mean for conservation? Role of genetic diversity in invasions by non-native species. How a single genetic change can have large consequences for the entire ecosystem.

Practical Content:

Practical 1 – Molecular phylogenetics: In this practical session students undertake their own genotyping experiments to infer the phylogeny of a set of *Mycobacterium tuberculosis* strains. Students perform gel electrophoresis of strain-informative DNA sequences amplified by polymerase chain reaction and construct a phylogeny of the various strains using techniques explored in preceding lectures. Students are assessed during the practical session via a pro-forma lab report consisting of a series of short answer questions (submitted at the end of the session).

Practical 2 Altruism This practical is carried out in the students' own time, in groups of 3 or 4. They read about altruistic behaviour in humans, then design and carry out their own experiment to test one of the supposed influences of humans on each other's behaviour. They are provided with a list of possible projects to get them thinking but are encouraged to design something new. They then fill in a template for their write-up, one for each group, report due 3 weeks later.

Practical 3 Animal physiology This practical will allow students to make measurements of the metabolic rates of living invertebrate animals, and to quantify the influence of body size or temperature on metabolism. Rates of change in the concentration of respiratory gasses will be measured, and data from different individuals will be combined to estimate metabolic scaling parameters.

Assessment: Completion and submission of results and questions relating to the practical.

Practical 4 Plant physiology Leaf photosynthesis of C3 and C4 plants using infra red gas analysis to monitor changes in concentration of CO₂ in air.

This practical involves students constructing a light saturation curve for maize (C4) and bean (C3) leaf photosynthesis. Students will use a simple gaseous CO₂ probe (an IRGA, Infra Red Gas Analyser) fitted to a programmable calculator to calculate steady state photosynthesis at differing light intensities in a closed chamber. Learning outcomes are associated with careful collection of laboratory data, quality control, calculation of suitable functional units to compare photosynthesis between leaves of varying shape and mass, understanding the three major gradients of the light saturation curve and how they relate to photosynthetic efficiencies.

Assessment: Completion and submission of results and questions relating to the practical.

Practical 5 Computer based ecological modelling This practical uses the interactive SimUText/Ecobeaker package that is loaded on the PAC room computers and accessible via My Trinity Apps. It is a self-directed practical which tests the Intermediate Disturbance Hypothesis by modelling forest succession and manipulating fire return time and intensity.

Assessment: Completion and submission of results and questions relating to the practical.

Learning Outcomes: On completion of this module students should understand some fundamental principles of evolution, genetics, animal and plant diversity, physiology and be able to describe characteristic features of selected ecosystems and their ecology.

Recommended Reading List: The topics and concepts presented in this module can be found in selected chapters of the following textbooks:

- **Biology, A global Approach.** Campbell *et al.* 12TH Edition. Pearson. Introduction to Genetic Analysis, chapter 18 (Griffiths *et al.*, 12th edition).
- **Introduction to Genetic Analysis.** Griffiths, Wessler, Carroll, Doebley (11th edition). W.H. Freeman and Co.
- **The Evolution of Plants.** 2nd Edition. K.J. Willis & J.C. McElwain. Oxford University Press.
- **Marine Ecology: processes, systems and impacts.** 3rd Edition. Kaiser *et al.*, Oxford University Press.

Assessment Details:

(A) **End of module written examination: 65% of module mark** Exam is comprised of 50 short answer/ multiple choice questions.

(B) **Practical assessments: 35% of module mark, five assignments equally weighted. Students must achieve a mark of at least 40% in the examination and in the course work. A student who fails the examination must repeat it, a student who fails the course work must submit supplemental exercise(s) as required.**

BYU22S01: Statistics and computation

Semester 1, 5 credits

Prerequisite: none

Module Coordinator: Professor Yvonne Buckley

Contact Hours: 20 hours Lectures; 5 x 3 hour practicals; 3 x 1 hour computational practise clinics. Attendance at practicals and computational practise clinics is mandatory & will be assessed.

Module Personnel: Professor Yvonne Buckley, Professor Dan Bradley, Professor Máire Ní Leathlobhair, Dr. Karsten Hokamp

Learning Aims:

Through lectures (content delivery, explanation), practicals (learning how to problem-solve, program and design), computational practise sessions (reinforcement of practical learning), and formative assessment (problem solving) we will provide students with a broad overview of the kinds of statistical and computational approaches that are commonly used across the biosciences and geosciences. We will introduce the basics of programming techniques that are transferable across programming languages. This module will emphasise the importance of hypothesis generation and testing for different data types. We will introduce the basics of data driven modelling. We will enable students to work individually and in small groups to problem-solve and communicate the problem and solution in different formats.

Module content: Programme of lectures and practicals

Lecture Topic	Lecturer	Practical
Introduction to Statistics & Computation for Biologists, part of the scientific method	Prof Buckley	Computational practise 1 (Dr Ní Leathlobhair)
Communicating quantitative biology	Prof Buckley	
Variables: types, sample distributions, summary statistics	Prof Buckley	Practical 1: R-Studio (Dr Ní Leathlobhair)
Principles of probability	Prof Buckley	
Data visualisation, regression, correlation , precision & accuracy	Prof Buckley	Computational practise 2 (Dr Ní Leathlobhair)
Normal distribution z score, p values correlation	Prof Buckley	
Computation Control Structures: branching & loops	Dr. Hokamp	Practical 2: Hypotheses (Dr Ní Leathlobhair)
Reusing code: functions and blocks	Dr. Hokamp	
Functional programming in R	Dr. Hokamp	
Programming in practice: document, debug, test & distribute	Dr. Hokamp	
Type I, type II errors	Prof Bradley	Prac 3: Programming (Dr Hokamp)
Sample error of the mean	Prof Bradley	
Reading Week		
The t distribution and t tests	Prof Bradley	MCQ test
The basics of Analysis of variance	Prof Bradley	
Chi squared testing, contingency tables	Prof Bradley	
Non-parametric tests	Prof Bradley	
Simple linear regression & parameter estimation	Dr Barnett	Computational practise 4 (Dr Barnett)
Multiple linear regression & ANCOVA	Dr Barnett	
Linear regression assumptions & generalised linear models	Dr Barnett	Prac 4: Modelling 2 (Dr Barnett)
Implementing an analysis workflow (support for final exam)	Dr Barnett	
		Prac 5: Modelling 2 (Dr Barnett)

Description of Lecture Content:

- Introduction to module & resources, expectations around effort & activities. Where statistics & computation fit with the scientific method. How elements of the module fit together.
- Communicating quantitative biology – visualisation, writing comprehensible code, reporting on statistics. Workflows in quantitative biology, using R Studio, saving scripts, working with data, good housekeeping.
- Types of variables, sample distributions and families of summary statistics
- Basic rules of probability
- Data visualization, regression, correlation
- The normal distribution, the Z score and P values
- Type I, type II error
- Sample error of the mean
- The t distribution and t tests
- Analysis of variance (very basic introduction to concept)
- Regression & parameter estimation (intercept, slope)

- Multiple regression & ANCOVA
- Control Structures: branching and loops
- Reusing code: functions and blocks
- Functional programming in R
- Programming in practise: documentation, debugging, testing, distribution
- Chi squared testing, contingency tables
- Non-parametric test analogues of normal distribution-based tests
- Implementing an analysis workflow [to support the dataset analysis assessment]

Description of Practical Content:

- Computation in R & R-Studio, getting started with R, data import & visualisation
- Hypothesis generation and testing using 2D:4D finger length ratios
- Data collection in class, hypothesis generation, response and explanatory variables, data visualisation, using ratios, error assumptions, transformations, correlation & regression
- Statistical modelling to parameterise functional response curves
- Data collection in class – different densities of sweets with different handling times generate different parameter estimates for handling time & search rate by linearising the Hollings Disc Equation for functional curves (types 1, 2, and 3). Data input & collation (Google sheets). Workflow & pseudo-code.
- Using R to visualise the data, perform linear regressions, extract parameter estimates and plot functional responses on top of data. Draw conclusions and communicate results.
- Introduction to programming in Scratch. Create a graphical simulation of prey/predator or infection scenario. This will require understanding and application of control flow and will result in potential experimental data that can be captured for statistical analysis

Learning Outcomes:

On completion of the module students will be able to:

- Design and use a work-flow and pseudocode for basic statistical and computational tasks
- Use R and R studio to import data, visualise data summaries and relationships, undertake basic statistical functions, models and tests, report summary statistics and draw conclusions
- Use different data types, understand what variables are and their types
- Generate and test hypotheses
- Parameterise biological functions using data
- Use control structures, functions and basics of good programming practise
- Generate and communicate well documented and tested code

Recommended Reading List:

Biocalculus: Calculus, Probability, and Statistics for Life Sciences. 1st Edition. J. Stewart and T. Day. Cengage. 2016

OpenIntro Statistics. 4th Edition. D. Diez, M. Cetinkaya-Rundel, C. Barr & OpenIntro. OpenIntro. 2019. <https://leanpub.com/openintro-statistics> (Available to download for a suggested price of \$15 or free).

Assessment Details:

50% CA in class practical assessments & computational practise submissions (45% practical assessments, 5% computational practise assessments) Best 4/5 practical marks used. All 3 Computational Practise marks used.

25% CA in class MCQ quiz based on lecture material in 1st half of semester

25% End of module exam

Module Website

Blackboard site will be set up by Executive Officer and managed by module coordinator & other instructors

Module Coordinator: Professor Yvonne Buckley, buckleyy@tcd.ie, 01 8963172

Biology Coordinator: Glynis Robinson, robinsog@tcd.ie, Phone: 01 8962895

Laboratory Manager: Siobhan McBennett, smcbrntt@tcd.ie, Phone: 01 8961049

Executive Officer: Lang Hu, btcadmin@tcd.ie, Phone: 01 8961117

PIU22991: History, Philosophy and Ethics of Science

Semester 1, 5 credits

Contact Hours:

20 hours of lectures + 10 hours of tutorials

Module Personnel: Dr Adrian Downey

Module Content

In this module, we will cover the 'nuts and bolts' of philosophy of science. Topics to be covered will include: the nature of scientific methodology, the variety of inference methods used in science (and their benefits and drawbacks), realism and anti-realism, and the role of values in science. By the module's end, students will be well situated to engage in further independent study of the topics in philosophy of science that interest them.

Learning Aims

Students will: 1) gain an excellent grounding in the 'nuts and bolts' of philosophy of science; 2) learn how to critically assess theses in science and philosophy; 3) learn about how philosophy is relevant for, and can contribute to, the practise of science; and, 4) gain the knowledge and skills requisite for engaging in further work in the philosophy of science

Learning Outcomes

By the end of this course, students will possess an excellent understanding of the core topics and ideas in the area of philosophy of science (see module content for more information), as well as how to critically engage with them. Consequently, they will be well-placed to: apply their knowledge in future scientific work; and, branch out and engage in their own independently guided research into the philosophy of science issues which interest them most.

Assessment

For 5 ECTS:

- 4x Written Responses of 750 words [25% each]

Module Website (See Blackboard)

Contacts

Module Co-ordinator: Dr Adrian Downey, Department of Philosophy (downeyad@tcd.ie)

Executive Officer: Gabe Hickey, Department of Philosophy (philosophy@tcd.ie).

TR060: BIOLOGICAL AND BIOMEDICAL SCIENCES – OPEN MODULES

BYU22204: Sustainable Production: Food, Drink and Drugs

Semester 1, 5 credits

Prerequisite: none

Module coordinator: Professor Mike Williams willimsm@tcd.ie Phone: 01 896 2424

Contact Hours: 16 hours lectures, 12 hours practicals

Module Personnel: M. Williams

Learning Aims:

The aims of this module are to familiarise the student with concepts of sustainable development, ecological farming, green pharma, sustainable diets, novel food and drink products, and how environmental impacts of the food/drink and drug industry are assessed using Life Cycle Analysis. Practicals will focus on techniques relevant to the biotechnology industry, sustainability of food production and health indices of global diets.

Module content:

Programme of lectures and practicals, two lectures a week.

Lecture Topic	Practical
Introduction to the module: concepts of sustainability and sustainable indicators	The Mediterranean Adequacy Index as a measure of the "healthiness" of national diets.
Sustainable diets and health	
Life cycle assessment	
Sustainability of the drinks industry	Hormonal control of seed germination
Environmental impacts of agriculture (GHG production)	
Environmental impacts of agriculture (reactive nitrogen pollution)	
Nutrition and Life cycle Assessments	The environmental footprint of the European diet.
Non food crops; biofuels, fiber and packaging	
Plant biotechnology	
Plant secondary metabolites I	
Reading week	
Plant secondary metabolites II	
Bioprospecting	
Sustainable Pharma	
Module Summary	

Learning Outcomes:

At completion of this module students should be better informed with regard to sustainable food, drink and drug production, be able to make informed decisions with respect to diet and food choice, be familiar with concepts and methodology of life cycle analysis of food production pathways, understand the practical aspects of tissue culture and how important such methodologies are in biotechnology.

Recommended Reading List:

Assessment Details:

The course will be assessed both by examination and continual assessment (70:30). Students must pass both components. Students who fail the exam must repeat it, students who fail course work must complete supplemental course work as directed. The examination paper will consist of one essay question from a choice of three (60%) and five compulsory short answer questions (40%). Practical activities will be assessed by laboratory report, data analysis and online MCQ as appropriate.

BYU22205: Influences on Animal Behaviour

Semester 1, 5 credits

Prerequisite: none

Module coordinator: Nicola Marples nmarples@tcd.ie

Contact Hours: Lectures and discussion sessions, 21 hours

Module Personnel: Nicola Marples; Elizabeth Nixon, Fiona Newell, Andrew Jackson

Learning Aims:

The Influences on Animal Behaviour module comprises a series of lectures, discussions, on-line assessments, and practicals. The module is taught jointly by the School of Natural Sciences and the School of Psychology, and covers a wide range of topics, beginning with a brief history of behavioural research. The students are then introduced to various aspects of perception and learning, cultural transmission, cognition, play and intelligence in animals including humans. Subsequent lectures explore the animal's behaviour in its environment and why all individuals of a species do not behave in the same way. The final lectures address the importance of an understanding of behaviour in relation to conservation in the wild and in zoos, and in relation to climate change. Lectures are supported by a series of online discussions in which there is ample opportunity for interaction and deeper exploration of the topics. The module includes student-led-learning leading to online assessment and fosters a responsible approach to learning by allowing students to complete most aspects of the assessment in their own time.

Module content:

Programme of lectures and practicals, two lectures a week are published online on Mondays, supported by live discussion session every Friday. There are two self-directed practical activities, and one supervised practical activity.

Lecture Topic	Lecturer	Practical
1. Introduction and Historical overview	Prof Marples	Practical 1: Dublin Zoo: animal behaviour introduced in lecture 1 and completed within three weeks in student's own time
2. Learning	Prof Marples	
3. Memory	Prof Marples	
4. Human sensation and perception	Prof Newell	
5. Human perception and attention	Prof Newell	
6. Play in animals	Prof Marples	Practical 2: Trials of Life (introduced in Lecture, completed by start of reading week)
7. Play in humans	Prof Nixon	
8. Cultural transmission	Prof Marples	
9. Imitation and teaching in animals	Prof Marples	
10. Intentionality in animals	Prof Marples	

11. Intentionality & Agency in Infancy and Childhood	Prof Nixon	
12. Navigation	Prof Marples	Practical 3: Collective behaviour (Practical session scheduled in timetable, Weds am and pm). Assessment introduced in Lecture 13, completed by end of lecture series.
13. Collective behaviour	Prof Jackson	
Reading Week		
14. Modelling behavioural polymorphisms	Prof Marples	
15. Animal Personalities	Prof Marples	
16. Behaviour and climate change	Prof Marples	
17. Behaviour and conservation	Prof Marples	
18. Behaviour, zoos and reintroductions	Prof Marples	

Lecture Content:

Introduction and Historical overview

Course over-view; historical context: Gilbert White, Pavlov, Lorenz, von Frisch, Tinbergen, four whys of Tinbergen, Skinner, Operant conditioning, Ethology vs behavioural ecology / ultimate vs proximate distinction, lab and field both needed, correlation does not prove causation

Learning

Innate vs learned, not complete distinction, uses of learning, uses of innate knowledge, types of learning: habituation, associative learning, Pavlov's experiment, unconditioned stimulus (US), conditioned stimulus (CS), conditioned response (CR), reinforcer, contingency, Instrumental learning, Thorndike's experiment, Skinner boxes, behaviour transfer, species differences in propensity to categorise, cognitive reasoning, theory of mind (mention); experimental design and Clever Hans; cost of learning and evidence for it, marsh wrens, hippocampal volume, vole spatial abilities, brain shrinkage without use.

Memory

Types of memory: Explicit/implicit; semantic, episodic, procedural, priming, learning through classical conditioning; examples and experiments relating to priming, sensory memory, eidetic imagery, echoic memory, short term and long-term memory, working memory, experiments on rehearsal, sleep and consolidation, events during training, interference during retention, primacy, recency, chunking, importance of forgetting.

Human Sensation and Perception

What are the basic sensory processes; How do we measure our perceptual abilities; how the brain perceives a constant world; perception and social psychology; how perception changes across the life course; individual differences.

Human Perception and Attention

What is the relationship between perception and attention; visual attention is selective and serial; attending to sounds; attending to multiple sensory stimulation; social attention and the role of eye gaze.

Play in animals

Definitions, characteristics, Fagen, play signals, self-handicapping, costs of play, age effects. Object play: Hutt play vs exploration, ravens, hunting practice. Locomotor play: Byers and Walker, stamina improvement. Social play: hierarchies, coalition formation, social competence, play predicting personality in human children, sex differences in humans and animals. Play to use energy, produce heat, and improve cognitive skills. Reward stops play.

Play in humans

Defining and recognising play in infancy and childhood; dimensions, functions, and development of play in humans (object play and tool use, locomotor play, non-social play, social pretend play, rough-and-tumble play), cultural variations in beliefs about play; meaning of play for childhood development.

Cultural transmission

Definition, speed of propagation, Galef experiment, neophobia, predator identification by contagion, maladaptive cultural taboos, other maladaptive features. Prerequisites: brain size, demonstrator, live tutor, social bond. Demonstrators blocking learning, scroungers, vertical, horizontal, and oblique CT, 2 case studies on CT of bird song.

Imitation and teaching in animals

Imitation and what's mistaken for it: Instrumental learning, stimulus enhancement, social facilitation, contagion, emulation, with examples and experiments for each; true imitation examples. Teaching definition, examples. Dialects, traditions in ape societies, stoneplay, speciation by cultural song learning in cactus finch, memes and permanent storage.

Intentionality in Animals

Griffin's questions, detecting consciousness, possible uses, orders of intentionality. Evidence for theory of mind: Abstract ideas, evidence from Pepperberg and Alex; Self-awareness, Povinelli's tests with chimps, manipulation and deception in animals, Menzel and chimps, triangulation method, Kummer and macaques, gaze following, Povinelli test with chimps, knowledge attribution, two-box test, non-verbal form for animals, Povinelli's evidence chimps can't, test on students, return to use of 2nd order intentionality

Intentionality & Agency in Infancy and Childhood

Early signs of intentionality: self-directed activity, means-end-differentiation, and the cognitive revolution at 9 months of age; emerging understanding of intentional-states in others; (Meltzoff and the "like me" framework, Tomasello and the simulation account); perspective taking and intersubjectivity; language (personal pronouns) and reflective forms of agency; intentional self-regulation.

Navigation

Simple contortion of path, swarming of bacteria, dead reckoning, piloting by landmarks, Tinbergen's wasps, bees, mice, food storing birds, wind and current maps, auditory maps, olfactory maps, celestial cues of direction, clock shift experiments, shoreline orientation, sun compass, zugunruhe experiments, magnetic sense, Walcott experiment, combining cues, "true navigation", shearwaters, monarch butterflies

Collective Behaviour

Emergent behaviours of groups; simple rules leading to complex outcomes, flocking in starlings, analysis of the film made during the practical in which students move according to simple rules to demonstrate emergent behaviours.

Modelling behavioural polymorphisms

Why don't all individuals respond the same, (ref to hormones, neuro, diurnal cycles), playing different strategies, personalities. Game theory: hawk/dove game and ESSs, Bourgeois butterflies, Anti-bourgeois spiders, wars of attrition, dung flies. Side blotched lizards, rock-paper-scissors games, mention of green beards.

Animal Personalities

Personality: Multiple mating strategies examples, horned beetles, isopods, age deciders in guppies, male mimicry in damselflies, cuckoo eggs, polymorphism in sparrows, feeding behaviour polymorphisms in cactus finch, producers and scrounger pigeons, bold/shy fish, lab vs wild

differences, predator inspection behaviour, predator inspection in fish, fast/slow great tits, foraging strategies, behavioural syndromes.

Behaviour and climate change

Brief evidence it's real, physiological responses to temperature change, effects of CO₂ on insects, phenological changes, examples of this, miss-timings, migration timing and route changes, limitations to adjustment by animals, range shifts, Hawaii as ecological disaster.

Behaviour and conservation

Conservation high priority, behavioural ecology can help: Counting populations: methods of counting, mark-recapture, call censusing methods, playback. Small populations: importance of breeding systems, monogamy and extinction, sexual selection, and extinction, Allee effect, clumping populations. Disturbance alleviation: sex-biased hunting, size biased hunting, light pollution, water turbidity, effects of sound pollution. Kakapo case study.

Behaviour, zoos and reintroductions

Behavioural ecology can help: imprinting problems, migration route learning, cross fostering, predator recognition, hunting skills, movement in the environment, stress, boredom, stereotypies, appetitive behaviours, natural behaviour management, contra-free-loading, inbreeding, mate choice, selection for personality types.

Practical Content:

Practical 1: Zoo animal behaviour

Self-directed visit to Dublin Zoo and completion of worksheet on animal signalling. Ticket provided by Biology Teaching Centre. After the visit students complete an online quiz in Blackboard.

Practical 2: Trials of Life Videos

Students watch, in their own time, up to four videos from the BBC series "Trials of Life" by David Attenborough. For at least two of the videos' students must demonstrate understanding of the concepts explored in the videos by completing associated MCQ tests.

Practical 3: Collective Behaviour

Timetabled practical carried out in the sports hall. The students experiment with how simple rules of movement cause emergent self-organising behaviours such as movement in a torus in the absence of any leaders. They then experiment with the addition of small proportions of the group as leaders and how this changes the emergent behaviours. Whole practical is filmed for later discussion in the collective behaviour lecture. This is followed by an online exercise.

Learning Outcomes:

On successful completion of this module, students will be able to:

- Place the study of behaviour in context related to a historical perspective.
- Describe the range of factors which influence animal behaviour, linking the understanding of behaviour to evolution, psychology, and a number of other areas of biology.
- Outline the basics of learning, both through classical mechanisms and through cultural transmission.
- Discuss the concept of animal intelligence and our understanding of consciousness in non-humans.
- Outline the main reasons for variation in behaviour between individuals.
- Discuss how and why animals play, and how they navigate.
- Outline the importance of animal behaviour studies in the context of conservation.
- Appreciate the range of effects climate change is having on animal behaviour.
- Build from a sound basis of understanding of basic behavioural ecological concepts.
- Organise and complete assessed work independently of the module co-ordinator.

Recommended Reading List:

- Niko Tinbergen (1972) Curious Naturalists. Penguin Books, London
- Marian Stamp Dawkins "Through Our Eyes Only? The search for animal consciousness" 1998
Oxford University Press

Module Delivery: All assignments will be published through Blackboard and all course work will be submitted through Blackboard. The module will be managed through Blackboard.

Assessment Details:

The module grade is divided between the end of module written exam (70%) and the course work (30%). Students must achieve a grade of at least 40% in both the exam and the course work. Students who fail the exam must repeat it, students who fail the course work must complete supplemental course work as directed.

Exam Format: 10 compulsory short answer questions

Course work components

- Practical 1 assessment: Worksheet from zoo marked pass/fail; online quiz marked electronically = 30% of course work;
- Practical 2 assessment: Trials of Life, four online MCQs of which a minimum of two are completed, the best two of four will be taken = 40% of course work.
- Practical 3 assessment: Online quiz for collective behaviour, marked electronically = 30% of course work

BYU22206: Microbes, Immune Systems and their Interaction

Semester 2, 5 credits

Prerequisite: BYU11101

Module coordinators: Carsten Kröger and Cliona O'Farrelly

Contact Hours: 17 hours lectures, 10 hours practicals

Module Personnel: Cliona O'Farrelly, Carsten Kroger, Kingston Mills, Marta Martins, Gareth Brady, Daniel Bradley, Sinead Corr, Rachel McLoughlin, Mary Canavan, Siobhan O'Brien

Learning Aims:

The microbial world existed successfully for 1.5 billion years before multicellular organisms began to appear. During that time, microbes evolved multiple defence mechanisms against potential competitors. Even when multicellular organisms evolved, microbes continued to exist successfully, often in harmony. Many of these mechanisms are conserved in multicellular organisms and used in defence against potential pathogens. In this module, students will learn about immune systems that have evolved over billions of years and about the complex interactions between microbes and their hosts which can lead to significant disease, but which are also required for health. Students will learn about the molecular and cellular biology of key pathogens (viral, prokaryotic and eukaryotic) which currently threaten human populations; they will learn about immune systems and the diverse mechanisms used by immune molecules and cells to detect and respond to these microbes.

Module content:

Programme of face-to-face lectures, laboratory practicals and online discussion sessions: two lectures a week, Thursdays at 14:00, Fridays at 15:00 practicals and discussion sessions on Mondays

Lecture Topic	Lecturer	Practical / Discussion Session
Introduction: Microbes, Immune Systems and their Interaction	Prof O'Farrelly / Prof Kröger	Practical 1: Microbial Offense and Defense 1 (Siobhan O'Brien)
Microbial Offence Mechanisms	Prof Kröger	
Microbial Defence Mechanisms:	Prof Kröger	Practical 2: Cells and Organs of the Immune System (Mary Canavan)
Combatting Infectious Disease: antimicrobials and antimicrobial resistance	Prof Kröger	
Introduction to Vertebrate Immune Systems	Prof O'Farrelly

Genetics of host resistance: Malaria	Prof Daniel Bradley	
Revision / Summary	Prof O'Farrelly	

Lecture Content:

Evolution of microbial and multicellular organisms

An introduction to how multicellular organisms evolved 'around' the microbial world and how the microbial world continues to exist successfully on the planet.

Microbial defence mechanisms

The microbial world existed successfully for 1.5 billion years before multicellular organisms began to evolve. During that time, microbes evolved multiple defence mechanisms against potential competitors e.g. bacteriocins, ways of blocking nutrient uptake, CRISPR cas9, restriction modification systems

Introduction to vertebrate anti-microbial defence

An overview of what vertebrate immunology is; how so much of microbial defence has been conserved; how competition for nutrient resources underpins immunometabolism immune activity and immune regulation; immune systems detect altered self as well as foreign and danger – anti-cancer immunity, virally infected cells, Natural Killer cells.

Where immunology happens and how: molecules, cells & organs of the immune system

Overview of the key immune organs, cells and molecules, their location structure and principle functions; introduction to haematopoiesis.

Microbiomes in health & disease

The human body is inhabited by communities of bacteria and other microbes on the skin, in the respiratory tract and oral cavity, the intestine and the genito-urinary tract. The composition of these communities differs significantly between different anatomical sites. The presence of a balanced microbial community is essential for appropriate immune system function and health and dysbiosis of the microbiota is associated with infection and with a variety of chronic disorders.

Innate immunity

Macrophages, epithelial cells and neutrophils - how they detect infection & danger; pathogen recognition receptors; how they signal.

Inflammation in health & disease

Inflammatory cytokines, chemokines, local inflammation systemic inflammation; chronic inflammatory disease, anti-inflammatory therapies.

Bacterial pathogens, mycobacterium.

Biology of the pathogen, intracellular life of *Mycobacterium tuberculosis* pathogenesis, epidemiology of the disease.

Adaptive immunity 1: immunisation:

Global effect of successful vaccines; structure and function of antibodies; primary and secondary responses, B lymphocytes, induction of an effective antibody response; infectious agents without vaccines.

Adaptive immunity 2 anti TB immunity:

How T lymphocytes are activated, DCs antigen processing and presentation; 4 populations of T cells; Mtb evasion of adaptive immunity; granuloma formation; role of TNF

Viral pathogens - influenza:

The influenza virus, pathogenesis of influenza virus infections, anti-virals.

Adaptive immunity 3: anti-flu immunity

The adaptive immune response against viruses; cytotoxic T cells; flu vaccine.

Parasite pathogens, malaria. Parasites are the giants of the pathogen world – they are responsible for major burden of disease across the globe. An introduction will be given to the major pathogenic parasites, with a focus on malaria.

Immune responses to malaria:

Innate and adaptive immune responses to natural malarial infection; malarial evasion of immunity; vaccine challenges

Combatting infectious disease – antimicrobials and antimicrobial resistance: How antibiotics (and other antimicrobials) revolutionised the treatment of infectious disease. How microbes become resistant to antimicrobial chemotherapy. The current global crisis of antimicrobial resistance.

Practical Content**PRACTICAL 1: Microbial offense and defence**

This practical will familiarise students with the strategies used by microbes to defend themselves against competing microbes and to cause damage to host cells.

Completion of this practical will enable students to:

- Demonstrate the lytic effects of bacterial toxins on eukaryotic erythrocytes
- Demonstrate the growth inhibitory activity of antibiotics produced by fungi and bacteria on a culture of *Escherichia coli*.
- Isolate antibiotic resistant mutants of *Escherichia coli*
- Determine the sensitivity of *Escherichia coli* to antibiotics
- Enumerate bacterial viruses and animal viruses using a plaque assay

PRACTICAL 2: Cells and Organs of the Immune System

This practical will familiarise students with the anatomy of the immune system so that they recognize the appearance of key immune organs, structures and cells and have some insight into their immunological primary roles.

Completion of this practical will enable students to:

- identify the cells and tissues involved in the mammalian immune system
- demonstrate awareness of the relative dimensions of the organs of the immune system
- be familiar with the appearance of the neutrophil, macrophage, dendritic cell, and lymphocyte

PRACTICAL 3: Immunological Activity: Antibody-Specific Detection & Phagocytosis

This practical will familiarise students with some immunological functions in particular the specific recognition ability of antibodies and phagocytic potential of macrophage-like cells.

Completion of this practical will enable students to:

- carry out an ELISA (enzyme-linked immunosorbent assay)
- generate a standard curve
- Perform blood-typing
- Carry out a phagocytosis assay

Learning Outcomes:**Completion of this module will enable students to:**

1. Demonstrate an understanding of the microbial world
2. Discuss the evolution of multicellular organisms
3. Discuss the evolution of 'defence' amongst microbes and multicellular organisms
4. Appreciate the components of and function of prokaryotic and mammalian immune systems
5. Describe how key pathogens cause infection and the immune response to pathogens
6. Describe how vaccines and antimicrobial agents work and their role in the control of infectious disease.

Recommended Reading List:

The topics and concepts presented in this module can be found in selected chapters of the following textbooks:

1. Campbell Biology 12th Edition Pearson (especially chapter on Immunology)
2. Prescott's Microbiology. 10th edition
3. Goldberg & Marraffini 2015. Resistance and tolerance of foreign genetic elements by prokaryotic immune systems — curating the genome.
Nat Rev Immunol. 15(11): 717–724. doi:10.1038/nri3910.
4. <https://www.youtube.com/watch?v=eUv1jkZshh0&t=629s> The Future of Immunology Lydia Lynch

Assessment Details:

30% of module mark for assessment of practical activities

70% of module mark for end of semester examination, combination of single essay and short answer format questions. Students must pass both assessment components.

Laboratory Manager:	Siobhan McBennett, smcbnntt@tcd.ie Phone: 01 896 1049
Executive Officer:	btcadmin@tcd.ie Phone: 01 896 1117

BYU22207: Genomes, Disease and Diversity

Semester 2, 5 credits

Prerequisite: BYU11101 or BYU11102

Module coordinator: Lara Cassidy cassidl1@tcd.ie Phone: 01 896 3521

Contact Hours: 16 hours lectures, 9 hours practicals

Module Personnel: Jane Farrar, Seamus Martin, Pepijn Luijckx, Kevin Daly, Lara Cassidy, Sinead Corr

Learning Aims: Through lectures (content delivery, explanation) practicals (practice in techniques and problem solving) we will provide students with a broad overview of the genomics and the impact of new approaches across the biosciences. We will introduce the basics of new technologies and show the application of these to study of: a) inherited traits, including Mendelian and complex human diseases; b) the non-inherited somatic genome with particular focus on cancer; c) human kinship and origins; d) the microbiome; and e) the genomics of ecology.

Module content:

Programme of lectures and practicals, two lectures a week, Tuesday and Thursday, practicals on Mondays

Lecture Topic	Lecturer	Practical
1. The inherited genome: Introduction to the human genome	Prof Farrar	
2. The inherited genome: Human disease and genomics	Prof Farrar	
3. The inherited genome: Genome wide analysis of human traits	Prof Farrar	
4. The non-inherited genome: Cancer, incidence, sources of mutagens, types of mutation	Prof Martin	Practical 1. Human Disease Analysis - Dr K. Daly
5. The non-inherited genome: Oncogenes and tumor suppressor genes	Prof Martin	
6. The non-inherited genome: The process of cellular transformation	Prof Martin	Practical 2. Microbial Analysis - Dr K Daly
7. The non-inherited genome: Cancer genomics, epigenomics and implications for treatment.	Prof Martin	
8. The Social Genome: Modern human diversity	Prof Cassidy	
9. The Social Genome: Our deep past	Prof Cassidy	
10. The Social Genome: Our recent history	Prof Cassidy	
Reading Week		
11. The Human Microbiome I	Prof Corr	Practical 3. Human Diversity analysis Dr K. Daly

12. The Human Microbiome II	Prof Corr	
13. The Human Microbiome III	Prof Corr	
14. The Ecological genome: Evolutionary genomics	Prof Luijckx	
15. The Ecological genome: Ecological genomics	Prof Luijckx	
16. The Ecological genome: De-extinction	Prof Luijckx	

Lecture Content:

Lectures are grouped in five themes:

The inherited genome, with topics including:

- Introduction to the human genome
- From genes to genomics
- Human disease and genomics
- Non disease traits and genomics

The non-inherited genome, with topics including:

- Cancer, incidence, sources of mutagens, types of mutation
- Oncogenes and tumor suppressor genes
- The process of cellular transformation
- Cancer genomics, epigenomics and implications for treatment

The social genome, with topics including:

- Patterns of modern human diversity
- Archaic human genomics
- European and Irish archaeological genomics
- Genealogy and forensic genomics

The microbiome, with topics including:

- Microbiology without culture
- the human microbiome
- Environmental microbiomics

The ecological genome, with topics including

- Conversation genomics
- Biodiversity
- De-extinction

Practical Content:

Practical 1

Cancer Genomics: Single Cell RNA Sequencing. Students will be introduced to the use of single cell RNA sequencing of tumors to assess cellular and genetic heterogeneity of oncogenic tissue samples. Advanced clustering techniques such as t-SNE will be utilized to assess tumor cell diversity, and gene enrichment tests will be performed using Gene Ontology (GO) criteria.

Practical 2

Microbial Genomics: Phylogenies and outbreak genetics. In the first of three computer-based practicals leveraging R-based skills from Semester 1, students will be introduced to the phylogenetics, sequence evolution models, and evaluating different methods of evolutionary tree construction. These skills will then be applied to genomic data from the 2013-2016 Ebola outbreak in

West Africa, and experience the potential role played by genome sequencing and phylogenetics in dissecting pathogenic outbreaks.

Practical 3

Population Genomics: Analysis of human population and archaic ancestry. Students will be presented with genome-wide data from a diverse range of both modern and ancient human populations and dissect how these relate to one another. This session will demonstrate the potential of allele frequency-based measures of genetic similarity, D statistics and test of introgression in adding to our understanding of recent and ancient human evolution, exploiting the availability of ancient genomic data.

Learning Outcomes:

On completion of the module students will be able to:

- Understand the core concepts in genomics
- Understand the interaction of genomic investigation and human inherited traits, including complex disease
- Understand the impact of genomics on the study and treatment of cancer
- Understand genomic impact in the study of human evolution
- Understand core concepts in microbial genomics
- Appreciate genomic impacts in ecological research.
- Key analytical skills gained in the statistics and computation for biologists' module will be reinforced through application to genomic data.

Assessment Details:

30% of module mark for assessment of practical activities

70% of module mark for end of semester examination, combination of single essay and short answer format questions. Students must pass both assessment components.

Contacts:

Module Coordinator: Lara Cassidy, cassidl1@tcd.ie, Phone: 01 896 3521

Biology Coordinator: Glynis Robinson, robinsog@tcd.ie Phone: 01 896 2895

Laboratory Manager: Siobhan McBennett, smcbnntt@tcd.ie, Phone: 01 896 1049

Executive Officer: btcadmin@tcd.ie, Phone: 01 896 1117

BYU22208: Molecular Nutrition

Semester 1, 5 credits

Prerequisites: BYU11101 and CHU11B01

Module coordinator: Richard Porter rkporter@tcd.ie Phone: 01 896 1617

Contact Hours: 16 lectures; 2 x 3 hour practicals; 2 x 2 hour workshops, 2 x 1 hour tutorials

Module Personnel: D. Nolan, R. Porter, G. Davey, M. Rooney, J. Hayes, G Robinson

Learning Aims:

The aim of this module is to develop an understanding of the molecular basis of life through study of the role of nutrients, not only as a source of energy but, as key elements that determine our cellular and whole-body physiology. The metabolism of carbohydrates, proteins and lipids and the role of vitamins will be presented in the context of human health and disease. The consequences of vitamin deficiencies, mechanisms that allow cells to survive starvation and metabolic derangements such as diabetes and those caused by alcohol consumption will be discussed.

The module builds on Section 2 (Chemistry of Life) of BYU11101 (Molecules to Cells I) and CHU11B01 (Chemistry for Biologists). While this module is a free standing and open module it does complement and expand on the lectures on metabolism in Module BYU22201 (Molecules to Cells II). An aim of the module is to prepare students hoping to pursue a moderatorship in the molecular biological sciences.

Module content:

Programme of lectures, practicals, tutorials, and workshops, two lectures a week, Thursday and Friday, tutorials or practicals some Mondays and Wednesdays.

Lecture	Staff	Practicals/ Workshops
Lecture 1: Introduction	Richard Porter	Workshop 1: Revision of Functional Group Chemistry (Robinson)
Lecture 2: Vitamins & Micronutrients 1	Derek Nolan	
Lecture 3: Vitamins & Micronutrients 2	Derek Nolan	
Lecture 4: Vitamins & Micronutrients 3	Derek Nolan	
Lecture 5: Lipids in Health & Disease 1	Richard Porter	
Lecture 6: Lipids in Health & Disease 2	Richard Porter	
Lecture 7: Lipids in Health & Disease 3	Richard Porter	
Lecture 8: Sugar, Fats, Obesity & Diabetes 1	Richard Porter	
Lecture 9: Sugar, Fats, Obesity & Diabetes 2	Richard Porter	
Reading Week		
Lecture 10: Sugar, Fats, Obesity & Diabetes 3	Richard Porter	Workshop 2: Preparing for Subcellular Fractionation Practical (Hayes / Rooney)
Lecture 11: Alcohol Metabolism & Addiction 1	Gavin Davey	
Lecture 12: Alcohol Metabolism & Addiction 2	Gavin Davey	

Lecture 13: Alcohol Metabolism & Addiction 3	Gavin Davey	Practical 1: Subcellular Fractionation (Hayes / Rooney)
Lecture 14: Nitrogen 1	Derek Nolan	
Lecture 15: Nitrogen 2	Derek Nolan	Practical 2: Lipids (Porter)
Lecture 16: Nitrogen 3	Derek Nolan	
Conclusions/wrap up	Porter	

Lecture Content:

Lecture 1: An overview of metabolism

Lecture 2, 3, 4: Vitamins & Micronutrients What are vitamins for? what do vitamins enable enzymes to do? key vitamins in metabolism & disease, the role of iron and minerals in nutrition.

Lectures 5, 6, and 7: Lipids in Health & Disease Key lipids & essential fatty acids, regulation of cholesterol and lipoproteins, lipidaemias & cardiovascular disease.

Lectures 8, 9, and 10: Sugar, Fats, Obesity & Diabetes Obesity & diabetes, dysfunctional metabolism in obesity and diabetes, treatment of obesity and diabetes.

Lectures 11, 12, 13: Alcohol metabolism, risks and benefits of alcohol consumption, addiction, and the brain

Lectures 14, 15, and 16: Nitrogen Capturing nitrogen, mobilizing amino acids, the essential role of nitrogen in life.

Practicals and workshops content:

Workshop 1: Revision of the organic chemistry functional groups introduced in first year and that are key to an understanding of molecular nutrition: acid, ester, amide, alcohol, thiol *etc.*

Workshop 2: Preparing for subcellular fractionation practical, making sense of enzyme activity calculations. This workshop will use given data to teach students how to calculate enzyme reaction rates, enzyme specific activity and yield and prepare students for the presentation of their experimental data obtained in the laboratory session.

Practical 1: Subcellular localisation of key enzymes of metabolism. The associated laboratory report will involve presentation of student's own data and analysis of the class data as a whole

Practical 2: Lipid analysis by thin layer chromatography

Learning Outcomes:

On completion of this module students will be able to:

- demonstrate an understanding of nutrient metabolism in humans.
- demonstrate an understanding of the mechanisms that regulate the transport and metabolism of sugars, lipids and amino acids.
- describe and explain, with examples, the importance of coenzymes (vitamins) in nutrition.
- describe how cells alter metabolism in response to variations in fuel / nutrient availability
- describe and explain, with specific examples, how nutritional stress alters metabolism and contributes to the pathogenesis of disease.
- Collect and interpret experimental data from laboratory and workshop sessions and use the data to solve problems themed around metabolism.

Recommended Reading List:

One of these general textbooks:

Lehninger Principles of Biochemistry (Seventh edition) Nelson & Cox (2017)

Biochemistry (Eighth edition) Berg, Tymoczko, Gatto & Stryer (2015)

Textbook of Biochemistry with clinical correlations 8th edition (2014) Thomas M. Devlin (Ed.) Wiley Press

Further reading will be recommended in lectures

Assessment Details:**End of semester written examination: 70% of module mark**

Three essays from a choice of five

Continuous assessment of course work: 30% of module mark

Practical 1 Laboratory Report = 15%

Practical 2 Assignment = 10%

Engagement with course work: attendance at two practicals, two workshops and one tutorial = 5%

Student must pass both exam and course work. Students who fail the exam must repeat it and students who fail course work must complete supplemental course work as directed.

Executive Officer: btcadmin@tcd.ie Phone: 01 896 1117

CHU22205: Chemistry for Biologists

Semester 2, 5 credits

Prerequisites: CHU11B01

Module Coordinator: Eoin Scanlan eoin.scanlan@tcd.ie

Contact Hours

20 lectures, 6 tutorials, 2 x 3hr practical

Module Personnel: Physical Chemistry: Prof Max Garcia Melchor and Organic Chemistry: Prof Scanlan

Learning Aims:

This module is specifically designed to introduce the student to chemical concepts essential to an understanding of the operation of living systems and the chemical technology of medicine, including: the chemical reactivity of important biomolecules, organic reactions of functional groups and their relevance to cell metabolism.

Module content: Programme of lectures and practicals

Teaching Week	Topic
1-3 (6 L)	Introduction to the physical chemistry of biomolecules: <ul style="list-style-type: none">Gibbs free energy and spontaneous reactions: link with metabolism and group transferThe temperature dependence of equilibria: van't HoffBinding reactions in biological systems: the dissociation constantColligative properties and osmotic pressureKinetics: Rate of a reaction, the rate constant, reaction order, concentration dependence, half lifeCollision theoryActivation energyCatalysis and lowering activation energyEnzymatic catalysis: Michaelis-Menten
4-12 (14 L) Week 7 = study week	<ul style="list-style-type: none">Functional groups: O, N and S groupsIsomerism: Isomers/stereoisomersChirality, Isomers in Biology Chemical reactions in cells <ul style="list-style-type: none">Substitution, addition, elimination, condensationReaction mechanisms, intermediates, and transition states.Key Functional group chemistry and key/common biochemical reactions Chemical reactions of enzymes and metabolism: <ul style="list-style-type: none">Transferring groups by displacement/substitution (transferases, esterases, peptidases, hydrolysis, phosphatases, kinases etc)Addition across a double bond (e.g. hydratases)Elimination: removal to create a double bond: e.g. (decarboxylation).Reactions involving enolates and carbocation intermediatesAddition of R-OH, R-NH₂ and R-SH to polarised double bonds. e.g., carbonic anhydrase, fumarase, enolase

	<ul style="list-style-type: none"> • Enolic Intermediates: e.g., aldose-ketose interconversions: triose phosphate isomerase • Beta cleavage and condensation, e.g., aldolase and synthases, decarboxylation of β-oxoacids; e.g. aldolase, citrate synthase, Rubisco; PEPcarboxykinase. PEP carboxylase • Oxidation-Reduction reactions: Nicotinamide/Flavin linked • Dehydrogenation of (i) an alcohol; (ii) an amine; (iii) thiol/aldehyde; (iv) acyl-CoA/carboxylic acid
--	---

Reading list/ Indicative Resources

Chemistry for the Biosciences, 3rd Edition, J. Crowe and T. Bradshaw, Oxford University Press.

Organic Chemistry, 2nd Edition, Jonathan Clayden, Nick Greeves and Stuart Warren; Oxford University Press.

The Organic Chemistry of Biological Pathways, 2nd Edition, John McMurry and Tadgh P. Begley, Roberts & Co.

Chemistry & Chemical Reactivity, 9th Edition, Paul Treichel, John Kotz, John Townsend, David Treichel, Brooks Cole.

Physical Chemistry for the Life Sciences, 2nd Edition, P. W. Atkins and J. de Paula, Oxford University Press.

Learning Outcomes

Students will develop a fundamental understanding of the physical chemistry principles of biological processes, including kinetics, activation energy and catalysis. They will learn about important biological transformations from an organic chemistry perspective and gain a deep insight into the mechanistic organic chemistry associated with a range of critical enzymatic processes. They will be able to recognize and assign stereochemistry in biomolecules. They will be able to understand the reactivity of key amino acids in enzyme mediated processes.

Methods of Teaching and Student Learning

A mixture of lectures, tutorials and hands-on laboratory practicals are used in the delivery of this module. The concepts are provided in traditional didactic style prior to the practical sessions. The practical sessions are formatted in order to further clarify concepts thus reinforcing learning. Tutorials provide an additional opportunity for the lecturer to assess understanding and gauge knowledge level of the students.

Methods of Assessment

Exam 80%

Lab 20%

Evaluation

Feedback given by students to DTL(UG) via online poll

Lecture and Tutorial Contact Hours

	Lectures	Tutorials
Physical Chemistry	6	2
Organic Chemistry	14	4
Overall Total	20	6

GSU22201: From Atoms to Rocks: Introduction to Geochemistry

Semester 1, 5 credits

Contact Hours

2 x 1 hour lectures / week for 10 weeks = 20 hours

1 x 2 hour laboratory / week for 10 weeks = 20 hours

Module Personnel

Dr. Michael Stock and Dr Juan Diego Rodriguez-Blanco

Module Outline

Geochemistry is a branch of Earth Sciences that uses chemical principles to study how the geosphere, hydrosphere, atmosphere and biosphere interact to process and distribute elements. This module will introduce fundamental chemical concepts, using geological examples to demonstrate their importance in Earth Science. The module provides an overview of high- and low-temperature geochemistry, outlining both how elements are processed in the Earth's crust/mantle, and providing an overview of the interaction between dissolved elements in natural waters and the rocks which they come in contact.

Module Learning Outcomes

On successful completion of this module, students should be able to:

- Illustrate the importance of geochemistry in Earth Sciences and the relationship between geochemistry and geology, environmental chemistry, oceanography, soil sciences and biology.
- Describe the electronic structure of atoms and ions, as well as the periodic table and the arrangement of atoms to form solids.
- Describe the main geochemical reservoirs Earth and the processes responsible for distributing elements within the crust and mantle.
- Outline the most relevant physicochemical phenomena occurring when minerals are dissolved in melts and aqueous solutions.
- Illustrate the most important processes occurring during the interaction of minerals/rocks with water and their relevance to environmental quality and therefore to humans.
- Define radiogenic and non-radiogenic isotope systematics and their importance in Earth Science.
- Relate the relevance of the carbon cycle and carbonate minerals with life, ocean evolution, climate and availability of elements.

Method of assessment

Theory examination (70%; 2 hrs) and in-course practical assessment (30%)

Recommended reading lists

Ryan, P. (2014) Environmental and Low Temperature Geochemistry. Wiley-Blackwell.

White, W. M. (2013) Geochemistry. Wiley-Blackwell.

GSU22205: Sedimentary Processes & Environments

Semester 1, 5 credits

Module Prerequisite – GSU11005

Contact Hours

Lectures = 20 hrs

Module Personnel

Dr Micha Ruhl, Prof Jerry Dickens, Dr Robin Edwards

Module Aims

Sediments and sedimentary rocks hold a rich history of how physical, chemical, and biological processes have changed over space and time. This module is designed to give basic information, so that the evolution of Earth's surface can be understood. We will share how one can take sediments and sedimentary rocks and reconstruct the past and appreciate the processes that led to what we can see today. This module will provide the fundamentals of sediments and sedimentary rocks, and how to think about Earth evolution.

The module will develop understanding of:

- Geological time
- Basic sedimentary rock-analyses: from observation, to interpretation
- How sediments are generated transported, deposited & preserved
- Different sedimentary depositional environments across the Earth system (past & present; continental & marine)
- How sedimentary archives provide records of (changes in) the past Earth system and past environmental & climate change processes

Module Content

Earth's climate and environments have changed on multiple temporal and spatial scales throughout its history, which significantly impacted on physical, chemical and biological processes across Earth's surface. Information on past climates and environments, stored in sedimentary archives, informs our understanding on present-day conditions at Earth's surface and provides constraints on future changes. Sedimentary materials storing such information can be found across most of the Earth's crust, both on land and in the oceans, and much of our understanding of Earth history comes from their examination.

This Module will introduce key physical, chemical, biological and sedimentary processes, deposits and examples of contemporary sedimentary depositional environments. It will analyse and explain the generation, transport and preservation of sediments, as diagnostic tools to link surface processes with the geological records of Earth history, as well as modern environmental change.

To achieve the module learning aims, the module will introduce examples of environmental change, and their impact on the sedimentary depositional environment at that time, such as Snowball Earth, Oceanic Anoxic Events, Hyperthermals, the Messinian Salinity Crisis, and Quaternary Glacial-Interglacial Cycles.

The above described module will prepare the student for related modules in Stratigraphy, Climate Change, Oceanography, as well as fieldwork, in Junior and Senior Sophister.

Learning Outcomes

On successful completion of this module students will be able to:

- Classify sediments and sedimentary rocks
- Provide technical descriptions of common sedimentary rock types and textures from hand samples and thin sections
- Explain the basic concept of “source-to-sink”, and how this links weathering of mountains, and transport and deposition of sediments
- Describe changes in sedimentary archives from outcrop observations, stratigraphic logs and/or petrological evidence
- Describe (changes in) in sedimentary archives, and interpret these in regards to changes in physical, geochemical and biological Earth surface processes, and changing environments
- Distinguish and describe temporal and spatial variability in Earth surface processes and how this links to sediment deposition locally
- Illustrate how Global Change processes (physical/ geochemical/biological) (have) shape(d) Earth’s surface, in the past, present, and future

GGU22006: Physical Geography: Dynamic Earth

Semester 2, 10 credits

Contact Hours

4 x 1 hr lectures / week for 10 weeks = 40 hrs

Module Personnel

Dr Pete Akers, Dr John Connolly, Dr Margaret Jackson, Prof Iris Möller, Dr Matt Saunders

Module Content:

Physical geography is an exciting scientific discipline that examines the Earth and how it functions. Geographers have already contributed substantially to scientific efforts to understand the emergence of truly globally significant human– environmental linkages. Physical Geography has thus been fundamental to investigating and modelling long-term changes to Earth surface process and dynamics. This type of knowledge is critical in allowing humans to live sustainably on planet Earth. In this module you study a wide variety of environmental systems, ranging from climate and weather to soils, beaches and rivers, to name just a few. The focus is to understand the location and character of landscape features such as mountain ranges and river valleys, and to explain why they came to be and how and why they vary depending on their geographic context. An underlying theme is to examine how aspects of physical geography affect human lives and, in turn, how people impact the dynamics of the physical landscape. This module will give students an understanding of key physical geography concepts. You will build on key areas of Geography from the JF Spaceship Earth and Anthropocene modules. Elements of the module are designed to prepare students for Sophister geography modules.

Module learning outcomes:

On successful completion of this module, students should be able to:

- Critically evaluate the influence of climate, topography and humans on the variability of landforms.
- Explain the theories underlying how and why specific landforms vary over space and time.
- Draw on specific example of landforms and landscapes to demonstrate the influence of climate, topography, and humans.
- Evaluate the complex and reciprocal relationships between physical and human aspects of environments and landscapes.
- Assess the relative importance of infrequent/extreme versus frequent/moderate events in driving landform change.
- Discuss the potential application of geographical concepts, techniques and expertise as a means of addressing a range of issues facing the Earth and its people at a global and local scale.
- Explain the importance and relevance of physical systems and landforms to the future of human society.

Assessment Details:

In course tests and assessment (100%)

MAU23302: Euclidean and Non Euclidean Geometry

Semester 2, 5 credits

Contact Hours

11 weeks, 3 lectures per week

Lecturer

Professor David Wilkins

Learning Outcomes

On successful completion of this module, students will be able to:

- justify with reasoned logical argument basic properties of triangles, circles and polygons in the Euclidean plane on the basis of recognized principles of synthetic geometry;
- identify, and justify with reasoned logical argument, significant geometric principles that are common to both Euclidean and non-Euclidean geometries, and also other geometric principles characteristic of non-Euclidean geometry;
- provide mathematical proofs of aspects of spatial intuition that do not involve the use of Cartesian coordinate systems and calculations in algebra.

Module Content

The initial focus is on the early books of Euclid's *Elements of Geometry*. The focus then switches to the construction of the hyperbolic plane, satisfying the postulates of Euclidean geometry with the exception of the Parallel Postulate, using methods of coordinate geometry in two and three dimensions.

- Euclidean geometry: an exploration of Euclid's *Elements of Geometry*, based on editions freely available online, with detailed discussion of selected propositions contained in the first four books, and including the geometric construction of a regular pentagon with straightedge and compass.
- Non-Euclidean geometry: stereographic projection; inversions of the Euclidean plane; conformal properties of stereographic projection and inversions, and their action on lines and circles; construction of the hyperbolic plane, hyperbolic geometry.

Module Prerequisite

None

Assessment Detail

This module will be examined in a 2 hour **examination**

Graduate Attributes

The Trinity Graduate Attributes are the qualities, skills and behaviours you will develop as a student at Trinity College, not only in the classroom, but also through your engagement in co- and extra-curricular activities (such as summer work placements, internships, or volunteering).

The Trinity Graduate Attributes are:

- To Think Independently
- To Act Responsibly
- To Develop Continuously
- To Communicate Effectively

Why are the Graduate Attributes important?

The Trinity Graduate Attributes enhance your personal, professional, and intellectual development. They also prepare you for lifelong learning and for the challenges of living and working in an increasingly complex and changing world.

The Graduate Attributes enhance your employability. Whilst your degree is your fundamental qualification, these Graduate Attributes will differentiate you as they encapsulate the transversal skills and capabilities sought by employers.

How will I develop these Graduate Attributes?

The Trinity Graduate Attributes will be developed and acquired by engagement with all aspects of your course and college experience throughout the four or five years of your programme of study. They are embedded in the curriculum and in assessments, through for example, undertaking independent research for your final year project, giving presentations, and engaging in group work. They will also be developed through co-curricular and extra-curricular activities. Running a club or society will improve your leadership skills while playing a sport will develop your communication and team-work skills.

Important information

Progression and Awards

Information on progression and awards can be found via the following webpage:

<https://www.tcd.ie/teaching-learning/academic-affairs/ug-prog-award-regs/index.php>

Attendance

All students should enter residence in or near Dublin and must begin attendance at the College not later than the first day of teaching term and may not go out of residence before the last day of teaching term unless **they have previously obtained permission from the Senior Lecturer through their tutor.**

Students must attend College during the teaching term. They must take part fully in the academic work of their class throughout the period of their course. Lecture timetables are published through my.tcd.ie, and on school or department notice-boards or in Blackboard before the beginning of Michaelmas teaching term. The onus lies on students to inform themselves of the dates, times and venues of their lectures and other forms of teaching by consulting these timetables.

The requirements for attendance at lectures and tutorials vary between the different faculties, schools, and departments. The school, department, or course office, whichever is relevant, publishes its requirements for attendance at lectures and tutorials on noticeboards, and/or in handbooks and elsewhere, as appropriate.

Attendance and Completion of Course Work: Freshman TR060.

1. Attendance at Junior Freshman and Senior Freshman BYU module laboratory sessions and completion of the associated exercises is compulsory, so that students acquire the competencies necessary for the Sophister level.
2. A student who does not attend a practical cannot submit an assignment based on, or associated with, that practical.
3. Students can self-certify for a maximum of one-third (1/3) of practical sessions and one-third (1/3) of the course work associated with an individual module (course work includes lecture MCQ tests, practical assignments, on-line exercises, on-line practicals, field work and any other exercise that contributes to the course work mark for that module).
4. A student who fails to attend more than one-third (1/3) of practical sessions in a module without submission of appropriate certification cannot pass that module without completion of a supplementary practical session, or an alternative exercise in the event that a practical is not possible.
5. Regardless of circumstances, a student who has passed the module overall but has failed the course work component may be required to complete additional exercises to acquire essential skills when deemed necessary by the module coordinator in consultation with the Directors of Freshman Biology Teaching and/or Biological and Biomedical Sciences.
6. Individual cases and exceptional circumstances will be considered on their merits

Assessment: Procedures for the non-submission of coursework and absence from examinations

All students must fulfil the course requirements of the school or department, as appropriate, with regard to attendance and course work. Where specific requirements are not stated, students may be deemed non-satisfactory if they miss more than a third of their course of study or fail to submit a third of the required course work in any term.

Full regulations on non-submission of coursework can be found via the following:

<https://www.tcd.ie/teaching-learning/academic-policies/assets/assess-nonsub-absence-sep2020.pdf>

<https://www.tcd.ie/calendar/undergraduate-studies/general-regulations-and-information.pdf>

At the end of the teaching term, students who have not satisfied the school or department requirements may be reported as non-satisfactory for that term. Students reported as non-satisfactory for the Michaelmas and Hilary terms of a given year may be refused permission to take their semester two assessment/examinations and may be required by the Senior Lecturer to repeat their year.

Further details of procedures for reporting a student as non-satisfactory are given on the College website at <https://www.tcd.ie/academicregistry/student-cases/>

Plagiarism

Plagiarism is interpreted by the University as the act of presenting the work of others as one's own work, without acknowledgement.

Plagiarism is considered as academically fraudulent, and an offence against University discipline. The University considers plagiarism to be a major offence, and subject to the disciplinary procedures of the University.

Plagiarism is defined as "taking someone else's work or ideas and passing them off as one's own". Plagiarism can occur in many ways; **deliberate** copying and pasting text from books, reviews, research papers, newspapers; from internet sources (e.g. Wikipedia), including social media, or copying from another student's assignment. Importantly, sometimes plagiarism can be **accidental** – such as when a student copies text from one of the above sources into their notes without noting (by inverted commas or a note-to-self) that it is copied verbatim from that source - and subsequently using this text in an assignment or exam answer. Furthermore, taking a segment of text from any of the above sources and simply rewriting each sentence in turn in a different tense OR using synonymous nouns, verbs, adverbs or adjectives is also plagiarism.

Therefore, it is very important for students to indicate in their notes, those that are written **in their own words** and those that are **copied** from published sources.

All plagiarism, regardless of it being **deliberate or accidental**, is **academic fraud**, is a most serious disciplinary offence, and is treated as such by Trinity College Dublin.

To help you guard yourself against accusations of plagiarism there is an online tutorial '**Ready, Steady, Write**' at <https://libguides.tcd.ie/plagiarism/ready-steady-write>

Detailed information on what plagiarism is, how to avoid it and the consequences of committing plagiarism are laid out at <https://libguides.tcd.ie/plagiarism>

The 'Ready, Steady, Write' tutorial is compulsory for all TR060 Junior Freshman students and it will be assumed that all TR060 Senior Freshman students have taken it, understand what plagiarism is and the consequences.

The College rules and further information can be read in Paragraphs 95-104, Part B of the College Calendar (<https://www.tcd.ie/calendar/undergraduate-studies/>).

As a rule of thumb you should: (1) write answers / assignments *in your own words*; (2) in your notes, keep track of from where and how you gather information from published sources; (3) rewrite key points of information *in your own words*; (3) use these key points to create a framework around which you write the essay *in your own words*.

Absence from College - Medical and Absence Certificates

The online SCIENCE ABSENCE FORM must be completed for all types of absences.

You can specify what type of absence once you start completing the form. You will find the link to the form on the following page <https://www.tcd.ie/Science/TR061/senior-freshman/>.

You must select from one of the three categories of absences in the online form...

Medical Certificates/Absence due to Illness (You MUST upload medical documentation ie; Certificate, Letter or Note, to section 14 of the Science Absence Form)

Where a student misses an assigned BYU module laboratory practical class, assignment, or any other course work activity through illness, they should complete the online Science Absence Form and submit a Medical Certificate/ documentation there too.

Self-Certification of Absence due to illness - three days or less

For periods of illness of **three days or less** (but **no more than seven days in any year**) a student may 'self-certify' their illness via the online Science Absence Form.

Note that students may self-certify for a maximum of one-third (1/3) of practical sessions and one-third (1/3) of the course work associated with any individual BYU module.

Sporting/ Other Absences (funerals etc)

Students who require to be absent from a laboratory practical class or tutorial (with or without an associated assessment) for any other reason, such as a sporting event or other situation, should

- Obtain permission from the Freshman Biology Teaching Coordinator (btcadmin@tcd.ie)
- Complete the online Science Absence Form well in advance of the event (preferably a week beforehand), and upload the Sporting, Club/Societies letter in section 14 of the absence online form

Students who will not be in attendance for any extended duration during term time must have permission from Senior Lecturer via their tutor to be absent from College. Please refer to the absence regulations noted in the previous page.

Excuses for absence, presented AFTER the event, **will not be entertained**. Students who anticipate that their sporting commitments may necessitate more than the occasional absence from College

(e.g. Sport Scholars, etc.) should discuss their situation with their Tutor and the Associate Dean of Undergraduate Science Education (ADUSE).

Absences from Examinations: Please note that the above regulations do not apply to absence from examinations. Students who are absent from examinations must contact their College Tutor as a matter of urgency and present any medical information/documentation to them.

Student Services

Trinity Tutorial Service

The Tutorial Service is unique, confidential, and available to all undergraduate students offering student support in all aspects of College life. The Tutorial Service is supported and co-ordinated by the Senior Tutor's Office which is located on the ground floor in House 27.

Opening Hours and Appointments

The Senior Tutor's Office is open for student appointments between 10.30am - 12.30pm and 2.30pm - 4.00pm Monday to Friday ONLY (email stosec@tcd.ie to arrange an appointment).

What is a Tutor?

A Tutor is a member of the academic staff who is appointed to look after the general welfare and development of the students in his/her care. Whilst the Tutor may be one of your lecturers, this is not always the case as the role of the College Tutor is quite separate from the teaching role.

When should I go to see my Tutor?

You should visit your Tutor whenever you are worried or concerned about any aspect of College life or indeed your personal life, especially if it is affecting your academic work. The conversation with your Tutor takes place in strictest confidence. Unless you give him/her permission to do so, s/he will not divulge information given to them to anybody, whether a member of College or to anyone outside College (to your parents/family for example). Your Tutor can only help you if s/he knows you are facing difficulties, so if you are worried about anything go and see your Tutor before things get out of hand.

Further information on the Senior Tutors Office and College Tutors may be found via the following webpage: **Senior Tutor Services-** <https://www.tcd.ie/seniortutor/students/undergraduate/>

Disability Services

The Disability Service aims to provide appropriate advice, support and information to help students and staff with disabilities. The Disability Service has in place a range of supports to ensure that students with disabilities have full access to the same facilities for study and recreation as their peers. Most students registering with the Disability Service request access to a range of supports that help the student reach their full potential while studying. Most students' needs are accommodated through these supports. The student decides what level of support they require.

For contact information or to make an appointment please contact the Disability Services – contact details are available via the following webpage: <https://www.tcd.ie/disability/contact/>

Learning Development

Student Learning Development offers support in a variety of study and learning skills including essay writing, exam preparation, study skills, self and time-management and note taking. Mechanisms of

support are workshops, individual appointments and drop-in clinics.
https://www.tcd.ie/Student_Counselling/student-learning/services/

Student Counselling

The Student Counselling Service is here to help you to manage any difficulties you are experiencing so you can enjoy and fully participate in your time here at College.

If you wish to make an appointment with the Student Counselling Service, please consider one of the options below. If you have any other queries you can call into reception on the 3rd floor of 7-9 South Leinster Street or contact us on:

Phone: (01) 896 1407

Email: student-counselling@tcd.ie

For further information visit the following webpage:

<https://www.tcd.ie/StudentCounselling/>

Useful College Websites:

Student Life

Student life offers information on Supports and Services, Clubs and Societies, Student Unions etc.,
<https://www.tcd.ie/students/>

Academic Registry

The Academic Registry is responsible for services that support the complete student lifecycle of Trinity College Dublin – from application to graduation. Academic Registry is located

For information on Registration, Fees, Grants, ID Cards etc. visit the Academic Registry (AR) in the Watts Building, on the first floor, or the visit the AR website: <https://www.tcd.ie/academicregistry/>

Student Accommodation

CAMPUS: The Accommodation Office is open Monday to Friday from 8.30am to 1pm and 2pm-5pm each day. Queries can be emailed to residences@tcd.ie, or you can telephone 01 896 1177 during office hours. After hours you can contact Front Gate at 896 3978 in case of difficulties or key problems. In Goldsmith Hall attendants are on duty in the residential area at weekends and overnight and they will assist with local problems. In the event of a serious emergency, particularly where you require the attendance of ambulance, fire or police services please telephone College Security at 01 896 1999 (internal 1999). To ensure a co-ordinated response please do not call these services directly. We recommend that you programme these numbers into your mobile phone using the prefix "01" before the number. <https://www.tcd.ie/accommodation/>

TRINITY HALL: The Accommodation Office is open Monday to Thursday from 9am to 4pm, and on Fridays from 8.30am to 4pm. The reception area is staffed 24 hours a day. During office hours the reception area is staffed by a member of the Accommodation Office Administrative Staff. Outside of office hours the reception desk is staffed by a member of the RSA (security) team. In the event of a serious emergency, particularly where you require an ambulance, fire, or police services, please ring our office number 01 8968024 for assistance or call-in person.

KAVANAGH COURT: Reception is at the entrance to the building, and it is open from 9am -5:30pm weekdays and closed at the weekend. However, reception opens for two hours over the weekend for parcel collections. (12pm-2pm) Phone number: +353 1 567 6977

Academic Year Structure 2023-2024

Emergency Procedure	<p>In the event of an emergency, dial Security Services on extension 1999. Security Services provide a 24-hour service to the college community, 365 days a year. They are the liaison to the Fire, Garda and Ambulance services and all staff and students are advised to always telephone extension 1999 (+353 1 896 1999) in case of an emergency.</p> <p>Should you require any emergency or rescue services on campus, you must contact Security Services. This includes chemical spills, personal injury or first aid assistance.</p> <p>It is recommended that all students save at least one emergency contact in their phone under ICE (In Case of Emergency).</p>
