

<b>Module name</b>	<b>Low Carbon Power Technology</b>
<b>Module code and mode of delivery</b>	Code: MEP55B16 Delivery: Blended Learning through Blackboard VLE/LMS, face-to-face teaching and tutorial discussions as appropriate (see below).
<b>Module ECTS Weighting</b>	10ECTS
<b>Semester of delivery</b>	S1 + S2
<b>Module Contact Hours</b>	44 hours lectures (hybrid synchronous online and face-to-face), 84 hours independent student learning, 22 hours tutorials and seminars (face-to-face as appropriate), 50 hours summative assessment and 50 hours continuous assessment in the form of class tests and student assignments which require literature review, technical presentations and the design and analytical modelling of energy power plants and combined systems.
<b>Module Coordinator</b>	Prof Stephen Spence
<b>Module teaching staff and academic titles</b>	Prof Stephen Spence
<b>Module description— content</b>	<p>Development and implementation of sustainable electricity generation is a principal requirement for modern society. This requires reliable energy supply with minimal toxic or greenhouse gas emissions. Achieving this requires diversification of energy sources, more efficient energy conversion and large-scale energy storage to smooth daily variations in generation and demand.</p> <p>This course will establish the foundational physical principles that enable the extraction of useful work / energy from various sources (thermal, fluid, chemical, nuclear and hydro), and present the current state of the art in power generation machinery. The important methods of power generation will each be examined, with foundational analysis, in the context of significantly reducing greenhouse gas emissions.</p> <p>The basic chemical and thermal analysis of combustion will be developed, to determine the energy release and carbon release from different fuels.</p> <p>Students will learn to analyse energy cycles for the important configurations of steam plants and gas turbines, including analysis of component performance including pumps, compressors, turbines, heat exchangers and combustors. The students will learn about and analyse advanced natural gas</p>

	<p>turbine power plants including cogeneration plants, hybrid GT Fuel cell plants and combined heat and power.</p> <p>The course will present alternative fuels and different ways of using those in thermal plant, including synthetic fuels, bio-fuels, hydrogen, ammonia and electrolysis.</p> <p>The main types of hydraulic turbines and pumps will be presented and analysed in the context of hydroelectric power generation and pumped hydro storage. Other methods of large-scale energy storage will be presented, including thermal storage, compressed air and gas, batteries and electrolysis. Students will learn the importance of effective storage as part of decarbonising energy and will analyse these systems to determine the overall round-trip efficiency of energy storage to judge their viability.</p> <p>Nuclear energy production will be presented, covering the history of nuclear, underlying physics, basic components, reactor types, neutron moderation, heat transfer and coolant system design.</p> <p>Students will learn to evaluate the different power generation technologies in the context of carbon emissions, reliability, efficiency, cost, flexibility and the impacts of integrating renewable sources along with thermal power plant.</p> <p>[Other important energy technologies, including wind, solar, tidal, fuel cells, smart grids, and distributed power, are addressed in other modules]</p>
<p><b>Module learning aims/objectives</b></p>	<p>The key objectives are as follows:</p> <ul style="list-style-type: none"> <li>• To give students sufficient fundamental understanding of a wide range of low carbon power generation technologies to enable them to undertake energy and carbon analysis of such systems.</li> <li>• To enable students to critically judge the feasibility and sustainability of power generation systems considering carbon emissions, fuel sources, energy efficiency, flexibility and cost.</li> <li>• To allow students to develop and use their own basic computational models to analyse and compare energy systems.</li> <li>• To enable students to judge the technical, physical, economic impacts of energy systems and present clear arguments with supporting data for choosing appropriate energy systems.</li> </ul>
<p><b>Module learning outcomes</b></p>	<p>On successful completion of this module, students should be able to:</p>

	<p>MLO1.1. Articulate the importance of efficient low carbon energy systems for the sustainability of modern society</p> <p>MLO1.2. Evaluate and compare the efficiency, sustainability and carbon impact of various power generation systems</p> <p>MLO1.3. Use fundamental engineering science to analyse and predict the performance of various low carbon energy technologies</p> <p>MLO1.4. Develop a basic computational model and use it to analyse a power generation system</p> <p>MLO1.5. Analyse and compare different energy storage systems and justify their importance for a low carbon energy grid</p> <p>MLO1.6. Demonstrate an understanding of the balance between commercial and environmental sustainability and the time scales of investments and benefits</p> <p>MLO1.7. Quantitatively assess the potential for various renewable energy technologies to complement or replace conventional power generation systems</p>
<p><b>Module assessment, separate components and their weighting to be mapped into SITS</b></p>	<p>This module is assessed through 100 % Continuous Assessment (A single SITS component).</p> <p>There will be four assignments during the two semesters:</p> <ol style="list-style-type: none"> <li>1. A technology review paper and seminar presentation to the class (40%).</li> <li>2. An analytical model of a heat exchange gas turbine generating system (25%).</li> <li>3. An analysis of a biomass steam power plant (20%).</li> <li>4. A class test on nuclear power technology (15%).</li> </ol> <p>Assignment timings and marks weightings will be published during the module.</p> <p>Any changes to the proposed assignment list above will be discussed with the class during the module.</p>
