School of Medicine

Nephrology clinical undergraduate training: Year 5

All care is taken to ensure that the information in this handbook is correct at the time of going to print.

Handbook Version 2.0
Date of Origin: August 2014
The final medical year Nephrology teaching is delivered in Tallaght hospital by Prof George Mellotte, Dr Catherine Wall, Dr Peter Lavin and Prof Mark Little, as well as by senior members of the NCHD team and nursing staff.

Michaelmas Term
Six full class lectures covering the following topics:
- Acute Kidney Injury
- Chronic Kidney Disease
- Glomerulonephritis
- Dialysis / Transplantation

Clinical specialty rotations
You will shadow the consult registrar and will be expected to see and assess new nephrology consults on the wards or emergency department. There may also be one or more third medical year student attached to the firm. Linking with the third year students is mutually beneficial: sharing your skills and additional clinical knowledge with them strongly reinforces your own learning. Your primary supervising consultant will be the on call consultant, who rotates every two weeks. The cornerstone of the teaching week is the Monday morning teaching rounds described below.

Acid base / electrolyte / kidney disease teaching rounds
Location
Clinical room in the dialysis unit at 11.30 am for 1 hour

Attendees
All 3rd meds attached to renal, any 5th med attached to renal, interns and SHOs of renal firm

SpR Coordinator
Consult registrar

Consultant Coordinator
Rotates, usually the consultant on call

2 cases to be prepared weekly, 1 covering an acid base or electrolyte disorder referred to the renal team (consult service or inpatient service) and 1 dealing with a kidney disorder (acute kidney injury / glomerular disease / etc). Cases are to be chosen in discussion with the consult registrar / renal registrar on Osborne Ward no later than the previous Friday afternoon. On the first Monday of the attachment, cases will need to be prepared on Monday morning.

The presentation should include a relevant brief history and results of preliminary investigations. The case should be presented as a diagnostic challenge with information withheld to allow for discussion around potential diagnosis / differentials / further diagnostics and interpretation of same. You will need an up to date medication list for the patient including drugs taken prior to admission / OTCs and drugs discontinued. This list should not be presented until the facilitator questions you regarding drug therapy. One person should present each case and the consultant will review the data and bring the group through the diagnostic process by asking for their input as well as requesting results of further investigations / medications etc. It is therefore essential that not all results are presented at the outset, rather a summary of the problem.

It is not necessary to present these cases electronically – but a typed synopsis of the case to be discussed will be useful for the group. The consultant will use the white board / flip chart to annotate.
Case example 1
You are asked to see a 51 year old man with a serum potassium of 6.7mmol/l and sodium of 129mmol/l. He has newly diagnosed inoperable pancreatic neuroendocrine tumour. His creatinine has risen from 60 to 160 over the last 10 days. Can you please see and advise on the likely cause of the above as well as recommend appropriate treatment.

Case example 2
You are consulted on a 72 year old woman with worsening leg swelling for the last 3 weeks. The initial working diagnosis was of CCF but her ECHO is normal and BNP is <500. She has a creatinine of 110umol/l and urine dip reveals 2+ protein. She is anaemic with a Hb of 9.7g/dl. Can you please see and advise

**Hilary Term**

**Nephrology CPC**
Usually in February or March, this is a full day interactive session where a detailed discussion of one or more cases is linked to didactic teaching on this topic. It is held in Tallaght and St James’s Hospital on alternate years.

**Clinical teaching, Tallaght Hospital.**
There is a mix of larger group tutorials (involving 1/4 of the class) and small group bed-side tutorials (8-12 students).

On Thursdays at 11am Prof Mellotte and Dr Lavin lead sessions in the Trinity Centre covering the theoretical aspects of clinical Nephrology. The group in Tallaght is split into two for these, with half attending sessions with Prof Mellotte and half with Dr Lavin, each for a period of 6 weeks. Therefore, every student should receive 6 of these sessions. They will cover the following topics:

- Acute Kidney Injury: pathophysiology, clinical assessment, differential diagnosis, investigations and initial management (including indications for urgent dialysis)
- Chronic kidney disease: pathophysiology, importance of blood pressure and proteinuria, strategies to slow progression and management of metabolic complications arising, renal bone disease, renal anemia
- Electrolyte disturbances: disorders of sodium and potassium balance, emergency management of severe hyperkalemia, acid/base disturbances
- Dialysis: principles of haemodialysis and peritoneal dialysis, preparing the patient for dialysis including creation of access, acute and chronic complications of dialysis, management of the dialysis patient presenting with another medical condition
- Transplantation: principles and complications of immunosuppression, causes and management of acute graft dysfunction
- Specific renal conditions: rapidly progressive glomerulonephritis, genetic renal disease, diabetic nephropathy, dysproteinemias and the kidney, reflux nephropathy, ischemic nephropathy

These semi-didactic sessions will be consolidated with small group tutorials delivered by Dr Wall (Monday 2pm, Osborne ward) and Prof Little (Friday 2pm, Haemodialysis unit). Each small group of 8-12 students should receive one tutorial from both Dr Wall and Prof Little. These tutorials will
focus on clinical examination of the patient with renal disease, with emphasis on dialysis, transplant kidney palpation and volume status assessment.

**Learning Outcomes**

<table>
<thead>
<tr>
<th>Learning Outcome</th>
<th>Details</th>
</tr>
</thead>
</table>
| 1. Elicit details of the following when taking a history of renal disease: | a. alterations in pattern of micturition; frequency, nocturia, dysuria  
   b. uremic symptoms; including anorexia, lethargy, pruritus  
   c. past medical history; hypertension, diabetes, peripheral vascular disease, urinary tract infection, malignancy  
   d. evidence of systemic disease; rash, joint pains, nose bleeds, infection  
   e. family history  
   f. drug history |
| 2. Examine the patient to identify and describe the following: | a. blood pressure  
   b. hydration / fluid overload  
   c. renal enlargement  
   d. shunts, fistulae for venous access  
   e. transplanted kidneys |
| 3. Demonstrate an understanding of the rationale and procedure for undertaking the following renal investigations and an ability to interpret the results | a. Urea and electrolytes  
   b. serum creatinine and estimated glomerular filtration rate  
   c. ultrasound of the renal tract  
   d. MRI of the renal tract  
   e. renal biopsy |
| 4. Demonstrate an understanding of the following renal problems. | a. acute and chronic renal failure  
   b. transplantation  
   c. systemic disease and the kidney  
   d. nephrotic syndrome  
   e. diabetic nephropathy  
   f. link between renal and cardiovascular disease |
| 5. Demonstrate an understanding of the importance of the following measures in preventing renal disease: | a. control of blood pressure  
   b. reduction in proteinuria |
| 6. Demonstrate an understanding of the effects and side effects of the following therapeutic options in relation to renal disease | a. dialysis  
   b. immunosuppression |
7. Ten clinical pearls you should endeavour to observe when attached the nephrology service

1. Feel and auscultate an arteriovenous fistula
2. Observe use of a tunnelled haemodialysis catheter
3. Palpate a transplant kidney
4. Assess the volume status of at least 5 patients
5. Perform a urinalysis
6. Witness a patient being attached to a haemodialysis machine
7. Witness a peritoneal dialysis exchange
8. Assess and present a patient presenting with acute kidney injury
9. Meet with the anaemia nurse to get an introduction to erythropoietin prescribing
10. Present a case at Monday morning teaching rounds
