

Appendix: Court Counsellor to Berlin Bohemian: Geography and Age in German Literary Production

Lukas Kuld*and John O'Hagan†

Contents

1 Figures	1
2 Tables	9

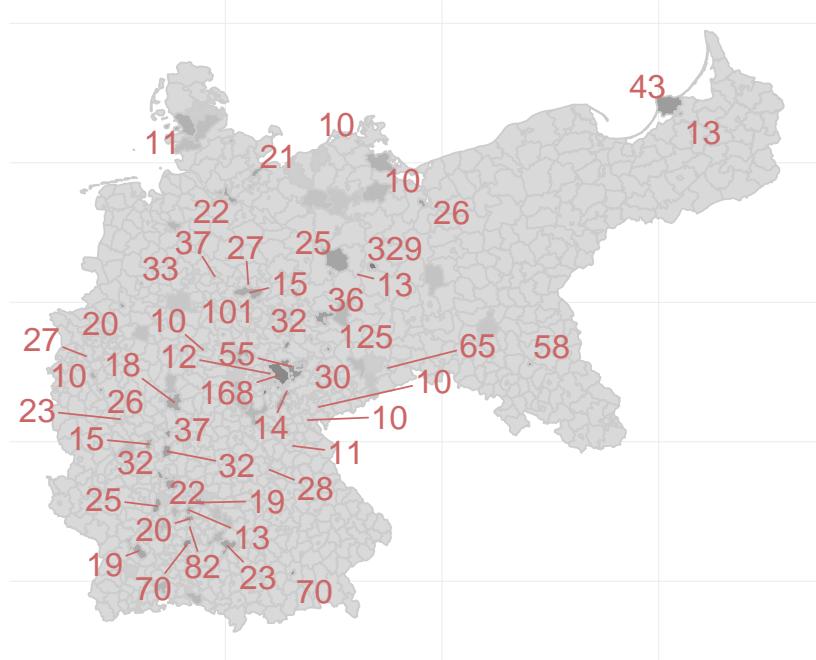

1 Figures

*TU Dortmund

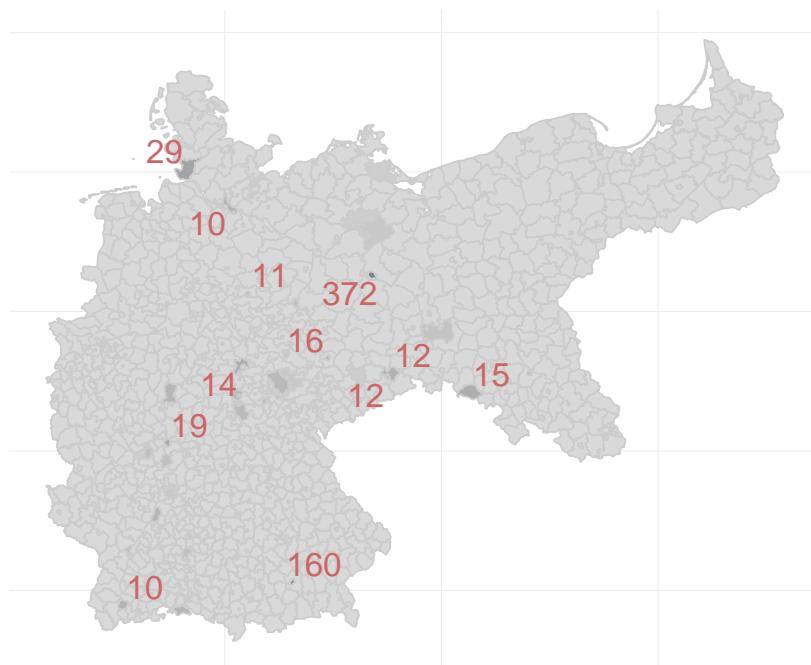

†Trinity College Dublin

Figure 1: Years of writers aged 18 to 50 per location

(a) Before unification

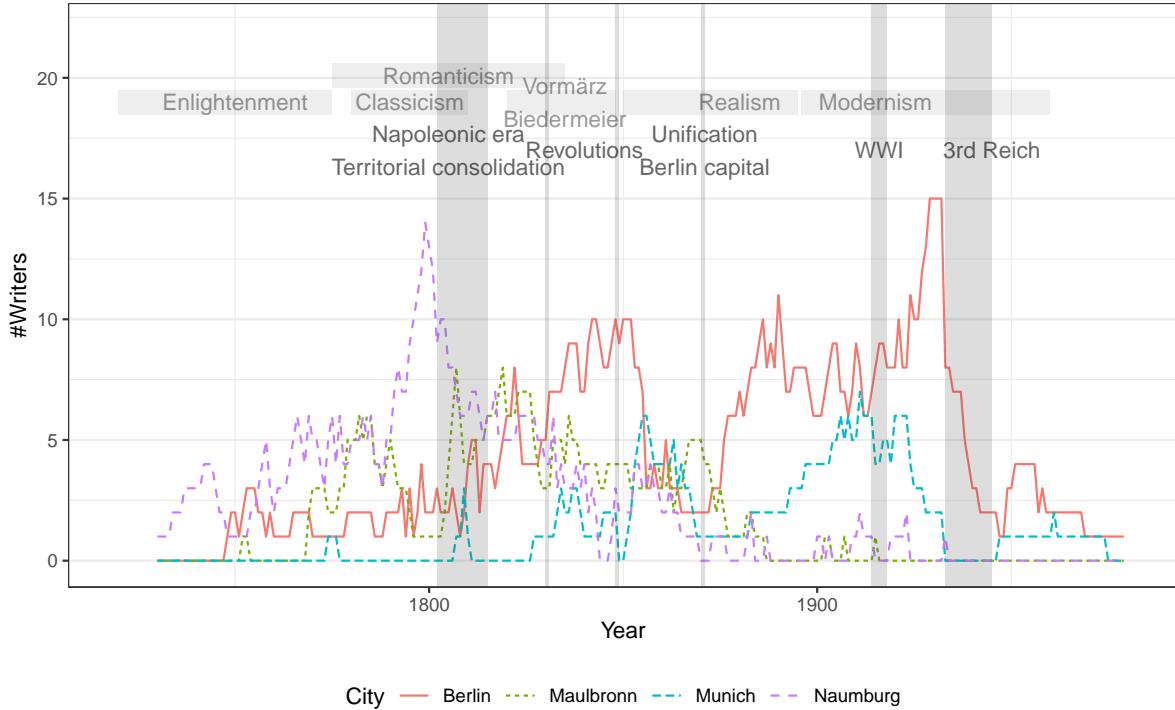

(b) After Unification

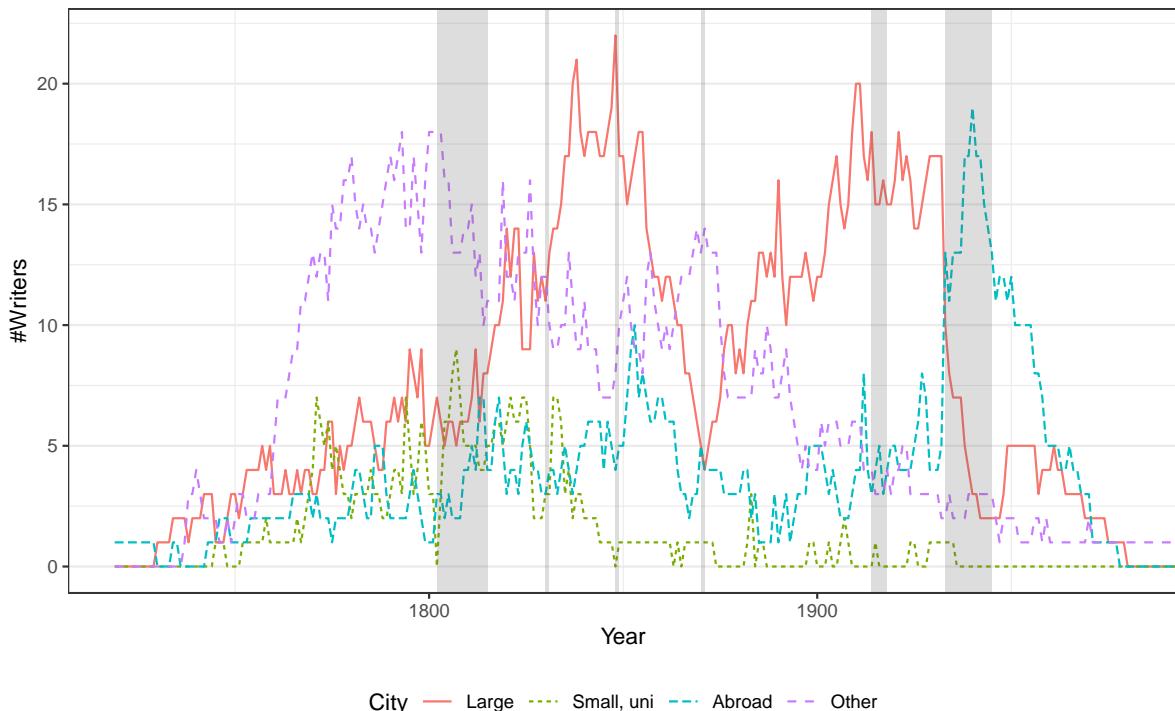

Notes: The maps show the sum of years that German writers reside in a district before and after the unification in 1871. Numbers are shown for districts with more than nine writer-years.

Figure 2: Location by year by agglomeration and city type

(a) Agglomerations

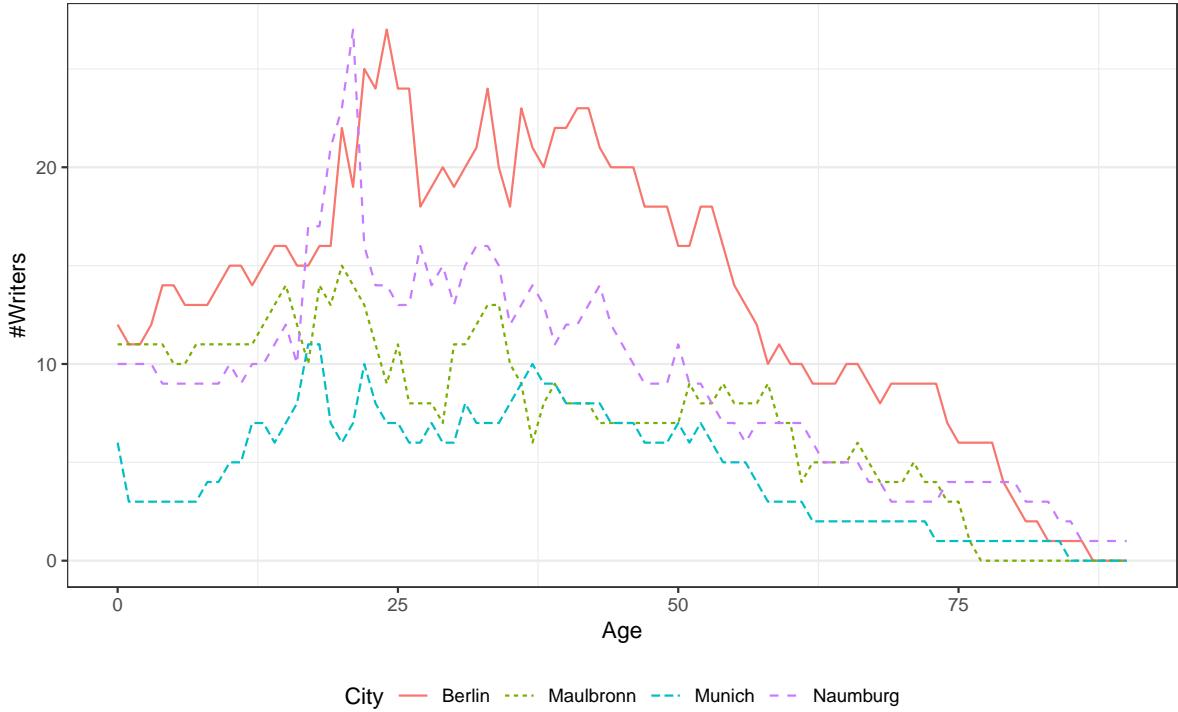

(b) Categories

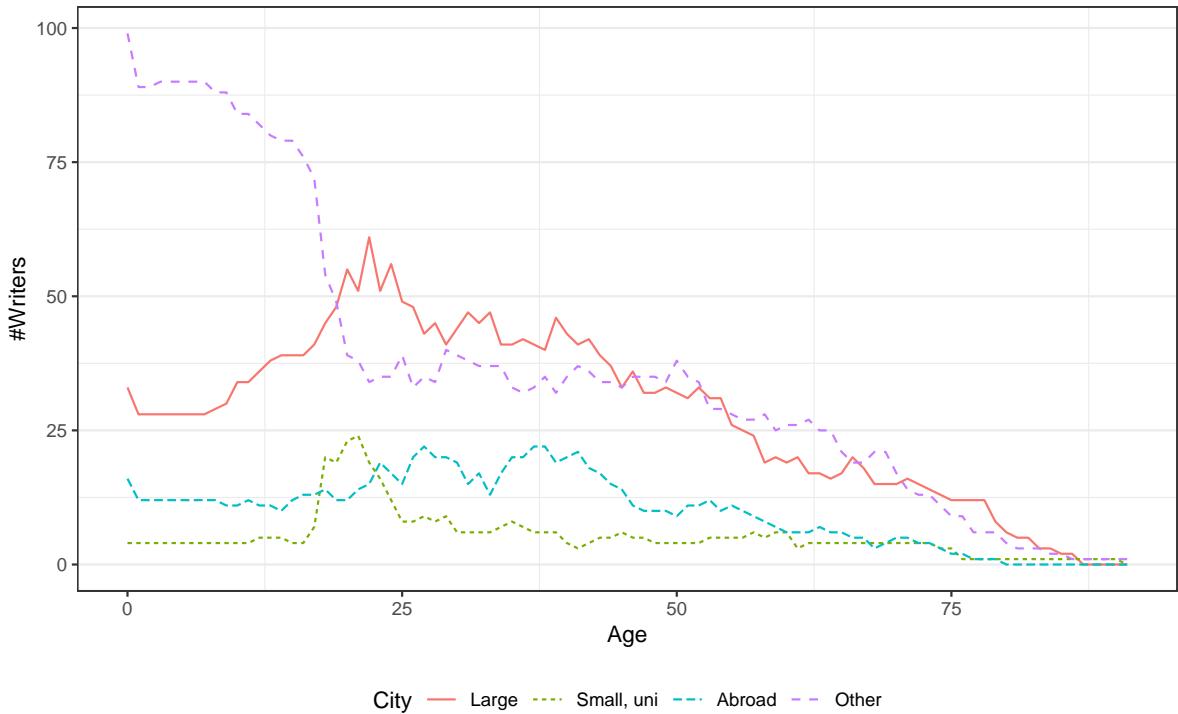

Notes: The plots show the number of adult writers per category. The first plot shows writers in circles with a radius of 60km. Naumburg importantly contains the cities Weimar, Jena, and Leipzig. Maulbronn contains Stuttgart, Tübingen, and Heidelberg.³ The second plot shows writers per category: major cities, small university cities, cities outside modern Germany and Poland, and other known locations within Germany/Poland.

Figure 3: Location by age and by agglomeration and city type

(a) Agglomerations

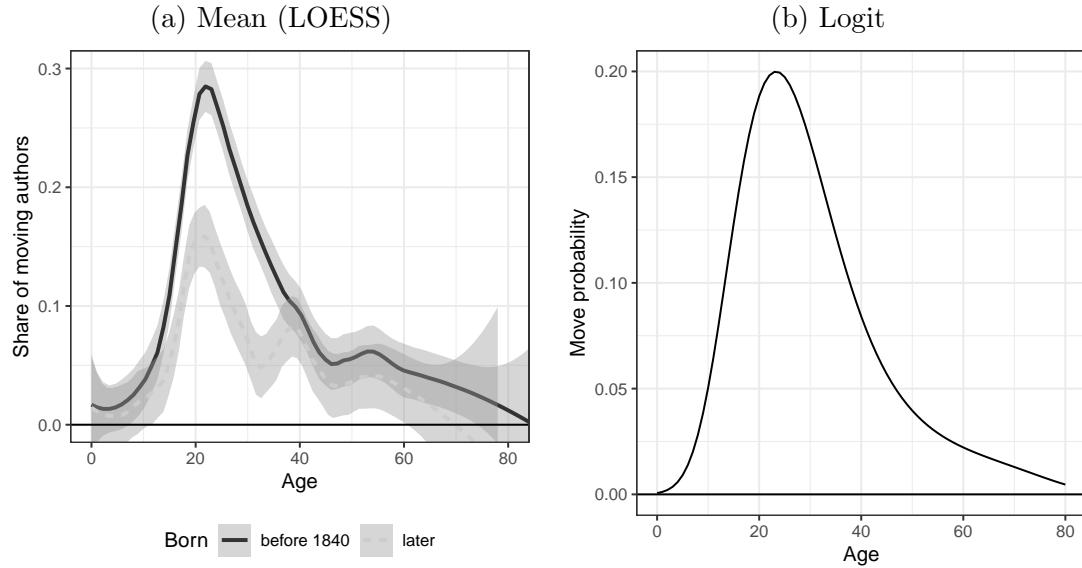

(b) Categories

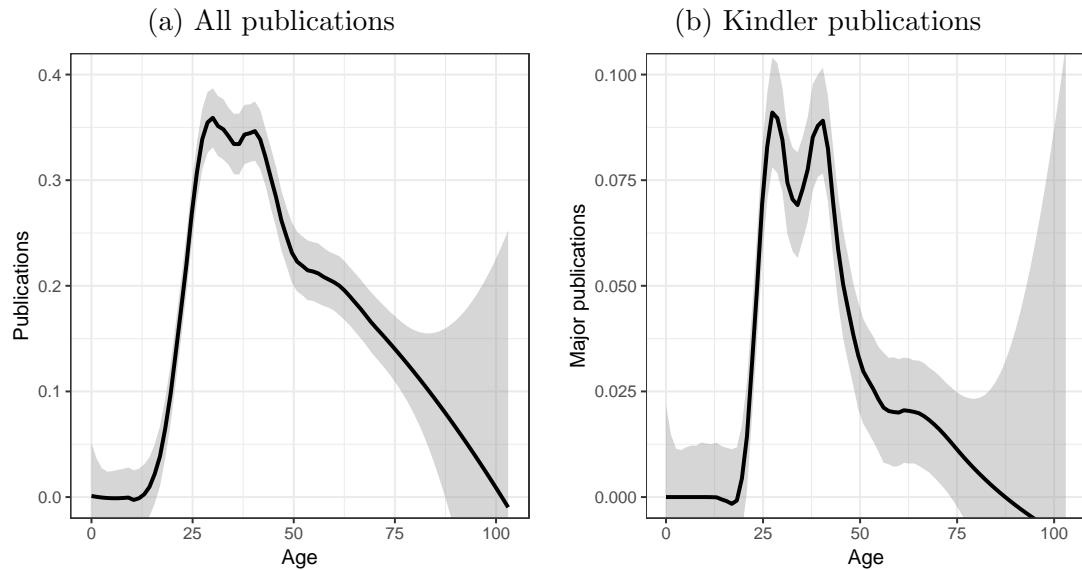

Notes: The plots show the number of adult writers per category. The first plot shows writers in circles with a radius of 60km. Naumburg importantly contains the cities Weimar, Jena, and Leipzig. Maulbronn contains Stuttgart, Tübingen, and Heidelberg.⁴ The second plot shows writers per category: major cities, small university cities, cities outside modern Germany and Poland, and other known locations within Germany/Poland.

Figure 4: Age and moves

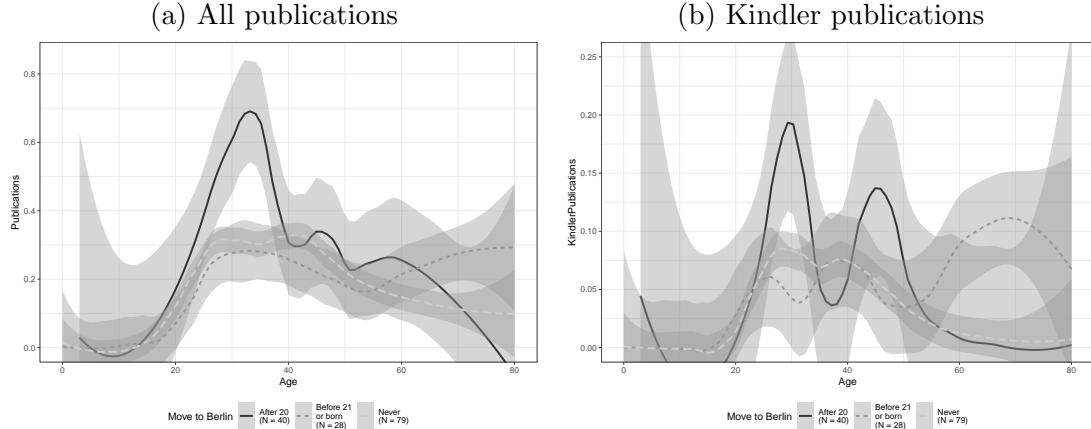

Notes: The left plots shows LOESS regressions of age on publications (span=0.3). The right plot shows predictions from a quartic polynomial for age in a logit model (see Table 1).

Figure 5: Age and productivity

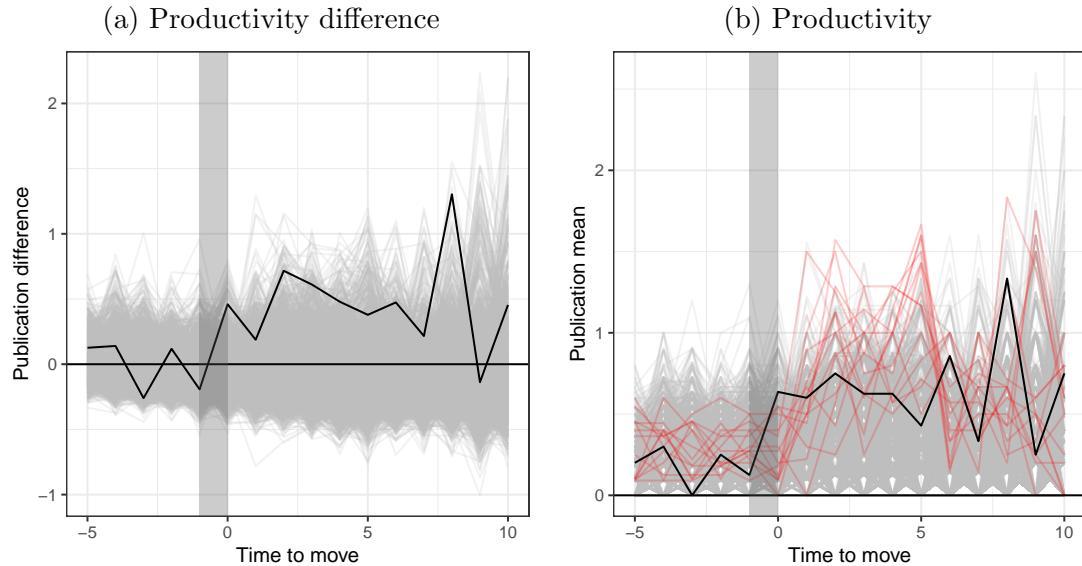

Notes: The plots show LOESS regressions of age on publications (span=0.3). The left plot shows all publications. The right plot shows publications included in the Kindler encyclopedia of literature.

Figure 6: Berlin: age and productivity

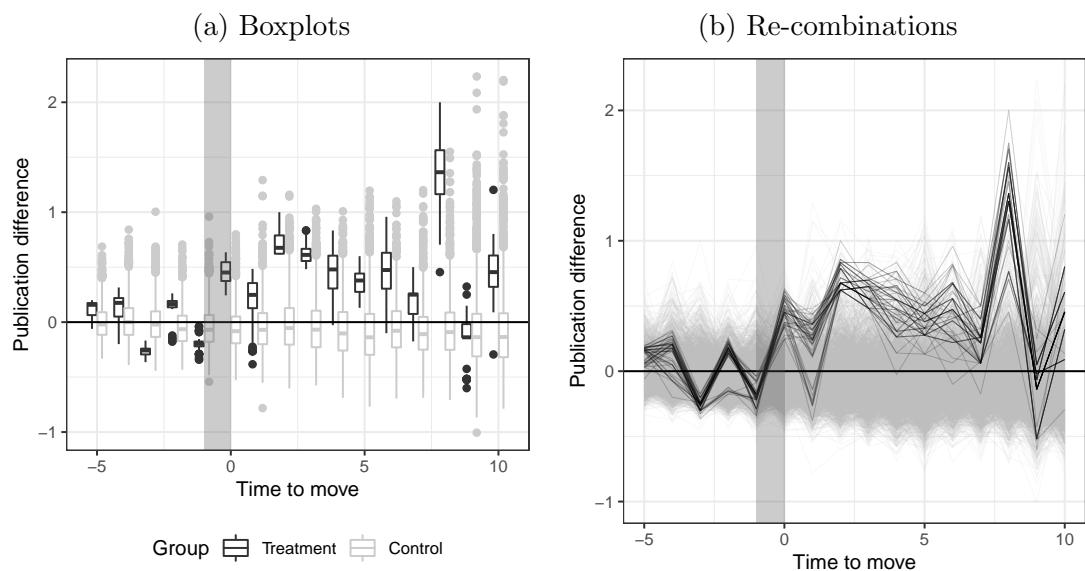

Notes: The plots show LOESS regressions of age on publications (span=0.4). The left plot shows all publications. The right plot shows publications included in the Kindler encyclopedia of literature.

Figure 7: Move to Berlin and productivity (group average and placebos)

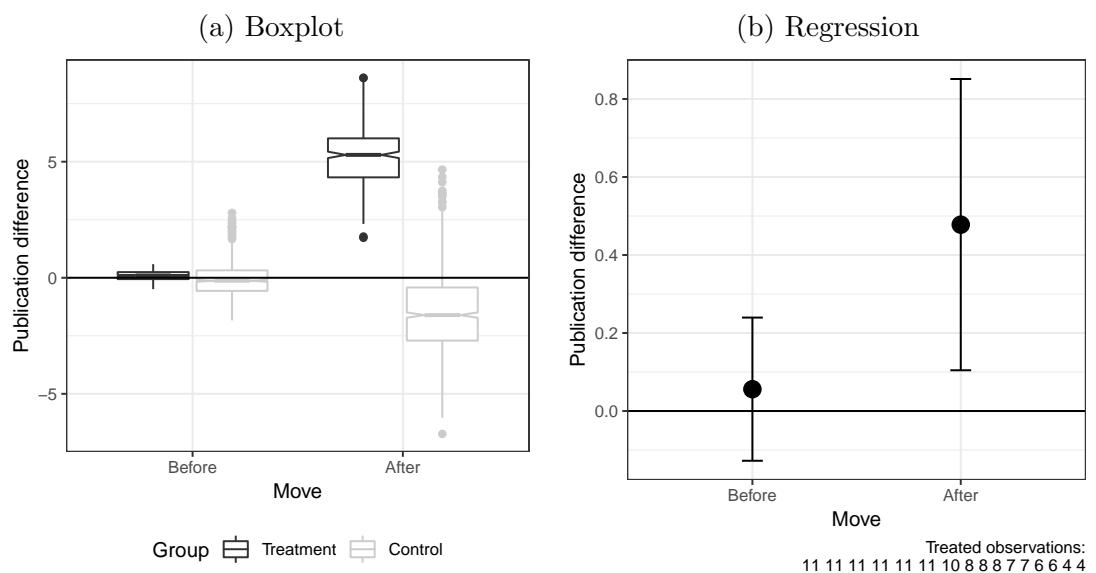

Notes: The left plot shows yearly publication differences between the mean of 14 writers who move to Berlin and a control group relative to the year of the move. The right plot shows just publication means. Grey lines depict pseudo groups of writers who never lived in Berlin. Red lines depict pseudo groups who have a higher publication average or difference after their move. See text for details.

Figure 8: Move to Berlin and productivity (group re-combinations)

Notes: The plots show yearly publication difference between groups that move to Berlin and control group relative to the year of the move. The dark black lines show averages for all combinations of 9 out of 11 writers who moved to Berlin aged between 25 and 35; the grey line show averages of pseudo groups consisting of writers who never moved to Berlin. See text for details.

Figure 9: Move to Berlin and productivity (aggregated)

Notes: The left plot shows a boxplot for Berlin and pseudo groups aggregated over the period before and after, otherwise equivalent to Figure 9a. The right plot shows estimates from a linear regression on the set of writers who moved to Berlin and their matched control.

2 Tables

All regressions take the form shown in Equation 1. Individual fixed effects α_i included as indicated. g denotes the respective link function.

$$\mathbb{E}(y_{it} | \dots) = g^{-1}(\alpha_i + x_{it}\beta + \sum_{j=0}^4 b_j age_{it}^j + \sum_{j=0}^4 a_j year_t^j) \quad (1)$$

Table A.1: Locations of writers

	Dependent variable (link function):				
	Move in year (logit)	Distance of move (log)	Distance to birthplace (log)	Distance to nearest author (log)	Berlin in year (logit)
	(1)	(2)	(3)	(4)	(5)
